Fisheries and Oceans / Pêches et Océans

Canada

Canadian Manuscript Report of Fisheries and Aquatic Sciences

Manuscript reports contain scientific and technical information that contributes to existing knowledge but which deals with national or regional problems. Distribution is restricted to institutions or individuals located in particular regions of Canada. However, no restriction is placed on subject matter, and the series reflects the broad interests and policies of Fisheries and Oceans Canada, namely, fisheries and aquatic sciences.

Manuscript reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in the data base *Aquatic Sciences and Fisheries Abstracts*.

Manuscript reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page.

Numbers 1-900 in this series were issued as Manuscript Reports (Biological Series) of the Biological Board of Canada, and subsequent to 1937 when the name of the Board was changed by Act of Parliament, as Manuscript Reports (Biological Series) of the Fisheries Research Board of Canada. Numbers 1426 - 1550 were issued as Department of Fisheries and Environment, Fisheries and Marine Service Manuscript Reports. The current series name was changed with report number 1551.

Rapport manuscrit canadien des sciences halieutiques et aquatiques

Les rapports manuscrits contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais qui traitent de problèmes nationaux ou régionaux. La distribution en est limitée aux organismes et aux personnes de régions particulières du Canada. II n'y a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques de Pêches et Océans Canada, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports manuscrits peuvent être cités comme des publications à part entière. Le titre exact figure au-dessus du résumé de chaque rapport. Les rapports manuscrits sont résumés dans la base de données *Résumés des sciences aquatiques et halieutiques.*

Les rapports manuscrits sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre.

Les numéros 1 à 900 de cette série ont été publiés à titre de Manuscrits (série biologique) de l'Office de biologie du Canada, et après le changement de la désignation de cet organisme par décret du Parlement, en 1937, ont été classés comme Manuscrits (série biologique) de l'Office des recherches sur les pêcheries du Canada. Les numéros 901 à 1425 ont été publiés à titre de Rapports manuscrits de l'Office des recherches sur les pêcheries du Canada. Les numéros 1426 à 1550 sont parus à titre de Rapports manuscrits du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 1551

ABSTRACT

Workman G.D., Olsen, N., Fargo, J., and Stanley, R.D. 2008. West coast Vancouver Island groundfish bottom trawl survey, R/V WE RICKER, May 23rd to June 19th, 2006. Can. Manuscr. Rep. Fish. Aquat. Sci.2841: viii + 83 p.

A bottom trawl survey of the west coast of Vancouver Island was conducted on the fisheries research vessel WE RICKER between May 23rd and June 19th, 2006. The survey was jointly conducted and funded by the Canadian Groundfish Research and Conservation Society (CGRCS) and Fisheries and Oceans Canada (DFO). It was the second in what is intended to be a long-term survey series, coordinated with other area-specific surveys that together cover the continental shelf and upper slope of most of the British Columbia coast. The objective of these surveys is to provide fishery-independent abundance indices of all demersal fish species available to bottom trawling, as well as to collect biological samples of selected species.

The survey conducted 165 successful tows from a selected set of 252 potential survey blocks. The mean catch per successful tow was 710 kg, averaging about 19 different species of fish and invertebrates in each. The most abundant fish species encountered were spiny dogfish, arrowtooth flounder, canary rockfish, Pacific ocean perch, yellowtail rockfish, sablefish, splitnose rockfish, Dover sole, and sharpchin rockfish. Biological data, including individual length, weight, sex, maturity, and age structure, were collected from 60 species of fish. Oceanographic data and net geometry were also recorded for most tows, including water temperature, depth, headrope height, and door spread. For the first time a Seabird SBE 16 + CTD was mounted on the net and logged temperature, depth, salinity and dissolved oxygen levels in situ during most tows. CTD casts were performed at 91 “La Perouse Project” sampling stations. Sea surface temperature and salinity was also collected throughout the survey.

RÉSUMÉ

Workman G.D., Olsen, N., Fargo, J., and Stanley, R.D. 2008. West coast Vancouver Island groundfish bottom trawl survey, R/V WE RICKER, May 23rd to June 19th, 2006. Can. Manuscr. Rep. Fish. Aquat. Sci.2841: viii + 83 p.

Un relevé au chalut de fond de la côte ouest de l`île de Vancouver a été réalisé à partir du navire de recherche halieutique NGCC W.E. RICKER du 23 mai au 19 juin 2006. Le relevé a été effecué et financé conjointement par la Canadian Groundfish Research and Conservation Society (CGRCS) et Pêches et Océans Canada (MPO). Il s'agit du deuxième relevé d'une série de relevés à long terme et qui sont coordonnés avec d'autres échantillonnages par secteur couvrant, ensemble, le plateau continental et la partie supérieure du talus de la majeure partie de la côte de la Colombie-Britannique. L'objectif de ces échantillonnages est d'établir des indices d'abondance, indépendants de la pêche, de toutes les espèces de poissons démersaux capturables au chalut de fond et de recueillir des données biologiques sur les espèces sélectionnées.

Des 252 blocs potentiels de relevés, 165 traits de chalut ont été fructueux. Les prises moyennes par trait de chalut réalisé se chiffraient à 710 kg. Quelque 19 espèces de poissons et d'invertébrés ont été prises en moyenne à chaque trait. L'aiguillat commun, la plie à grande bouche, le sébaste canari, le sébaste du Pacifique, le sébaste à queue jaune, la morue charbonnière, le bec-de-lièvre, la sole à petite bouche et le sébaste à menton pointu étaient les espèces les plus abondantes. Des données biologiques (longueur, poids, sexe, stade de maturité et structure d'âge) ont été recueillies pour 60 espèces de poisson. Des données océanographiques et des données sur la géométrie du chalut (température de l'eau, profondeur, hauteur de la ralingue supérieure et écartement des panneaux) ont également été recueillies pour la plupart des traits. Pour la première fois, une sonde CTD Seabird SBE 16 + a été installée sur le chalut et a permis de consigner in situ différentes données (température, profondeur, salinité et concentration d'oxygène dissous) pour presque tous les traits. Des mouillages de sonde CTD ont été effectués à 91 stations d'échantillonnage du Projet La Pérouse. La température et la salinité de la surface de la mer ont également été recueillis tout au long du relevé.

INTRODUCTION

The West Coast of Vancouver Island (WCVI, Figure 1) is a major contributor to the Canadian west coast bottom trawl groundfish fishery with around 6000 – 9000 metric tonnes of mixed groundfish being landed from this area annually. Table 1 lists average annual catches comprising 95 % of the bottom trawl catch from the WCVI by species between 1996 and 2005. Species for which this area contributes significantly to coast wide catches are longspine and shortspine thornyheads (*Sebastolobus altivelis and Seb. alascanus*); Dover and petrale sole *(Microstomus pacificus and Eopsetta jordani)*; canary, yellowtail and bocaccio rockfishes (*Sebastes pinniger, S. flavidus and S. paucispinis*); lingcod (*Ophiodon elongatus*) and spiny dogfish (*Squalus acanthias*).

Sinclair et al., (2003) recommended the development of fishery independent relative abundance indices using random depth stratified bottom trawl surveys for the entire BC coast. Based on that recommendation a survey was conducted in the summer of 2003 in Queen Charlotte Sound (Olsen et al., 2007a); based on the success of that survey a "**Survey Strategy**" was developed to provide bottom trawl survey coverage for most of the trawlable bottom on the BC coast. As part of the strategy the Department of Fisheries and Oceans (DFO) conducted the first of what is intended to be a continuous series of biennial surveys of the WCVI in 2004 (Workman et al., 2008) . Prior to that survey the most recent historic surveys were in 1996 (Olsen et al., 1997), and 1985 (Leaman et al., 1988). The US National Marine Fisheries Service (NMFS) surveyed the lower west coast of Vancouver Island as part of their triennial bottom trawl survey between 1977 and 2001.

Objectives of the survey were to collect detailed distributional and abundance data for all species available to bottom trawl gear; collect detailed biological data for selected species; collect environmental data at Established "La Perouse Project" time series CTD stations; incorporate a new net mounted CTD into the survey; and improve automated data logging systems.

This report is not intended to provide a comprehensive analysis of the data collected during the survey but rather to serve as an instrument to document procedures, provide general results and capture meta-data from the survey. Detailed analyses of the biological and catch data collected during the survey will be the subject of separate reports.

METHODS

VESSEL

The CCGS WE RICKER (Figure 2) is a 58 m, 413 tonne, steel stern trawler with 2500 hp. It is equipped with two 15 tonne trawl winches each carrying 800 m of 28 mm fiber core main trawl warp. For a complete description of the WE RICKER go to the Canadian Coast Guard Web site at: **http://www.pacific.ccg-gcc.gc.ca/fleet-flotte/fleetinfo/wericker_e.htm**

NET AND RIGGING

In an effort to standardize survey gear two new Atlantic Western IIa "box trawls" were fabricated in the spring of 2006. These nets are nearly identical in design to the nets

used during multispecies groundfish surveys between 2003 and 2005 (Olsen et al., 2007a, b, c, Workman et al, 2008, Workman et al, in prep). The two nets used previously had slight differences in materials and footrope construction which were eliminated in construction of the new nets. Differences in the older nets included the use of combination wire instead of chain for winglines, the use of corkline instead of combination rope for the headrope, the use of chain instead of poly rope for the foot rope and the size of chain used for the bolchline, and fishing line.

This net design was recommended by commercial fishermen as a reliable general purpose net suitable for survey work due to its durability and ease of repair. Two trawls were purchased by the Canadian Groundfish Research and Conservation society (CGRCS) a third net was purchased by the DFO in the spring of 2006. Details of net construction and rigging are listed in Table 2 and shown in Figure 3. In the event of net damage the crew was required to repair the net to its original specification before putting it back into service, broken mesh had to be repaired between tows and any missing web had to be replaced with new.

TRAWL MONITORING

SIMRAD ITI net mensuration gear was used to measure door spread, wingtip spread, headrope height, depth and temperature during most trawl sets. The ITI system consists of sensors that are attached at various locations on the net, a ram-mounted transducer that receives signals from the sensors via an acoustic link, and a deck unit that processes and displays data from the sensors. Sensor data were also recorded manually by the chief scientist on supplemental bridge log forms. Unlike the pilot WCVI survey in 2004 the Furuno FS20 Net sonar was not used during this survey due to concerns over its impact on catch rates for some species.

TRAWL MOUNTED SCIENTIFIC PROBES

A Mac Marine (NMFS) bottom contact sensor (BCS) recorded net contact with the bottom at six second intervals. This device consists of a digital inclinometer, and a data logger enclosed in a heavy stainless steel housing. The sensor is hung off the foot rope on a short chain bridle and measures tilt angle with an angle of 90 degrees indicating the device is vertical and an angle of 0 degrees indicating horizontal.

A SeaBird Electronics SBE 39 temperature and depth recorder was attached to the head-rope of the net and logged temperature and depth at 10-second intervals throughout the day. The SBE 39 was mounted in a two-inch PVC pipe housings for protection and attached to the head-rope using chain and karabiners

A SeaBird Electronic SBE 16Plus CTD was also attached to the headrope of the net. It was configured to record depth, temperature, conductivity and dissolved oxygen at 10 second intervals throughout the each tow. The probe was configured to remain in quiescent state until the salinity cell recorded a voltage indicating it was submerged in salt water, it then turned on the pump for the conductivity and oxygen sensors and started logging data. To protect the CTD it was mounted in a section of 20 cm diameter PVC pipe (housing) using stainless steel band clamps. The housing was then sewn to the top square of the net in a mesh bag; a chain knot was used at the front end of the bag to allow the CTD to be removed from the net between tows.

SURVEY DESIGN

The survey area encompasses the west coast of Vancouver Island from the Canada/US border in the south to Quatsino Sound in the north (Figure 4). The survey did not cover the area north of Topknot Island due to the scarcity of trawlable bottom. Depths surveyed ranged from 50 – 500 m; the depth stratification scheme was the same as that used in 2004 (Table 3). The survey frame did not include inlets or enclosed waters. The overall survey surface area (50-500 m) is about 12,918 km^2.

An analysis conducted prior to the 2004 survey determined that 180-190 tows would be required to generate high precision indices (RE < 0.2) for 20 or more species. Results of the 2004 "pilot" survey supported this recommendation with only 5 species achieving the target RE with 90 usable tows. With a full ship's cycle of 28 days we estimated that between 170 and 180 usable tows could be completed in the available time.

BLOCK SELECTION AND SURVEY MANAGEMENT

Initially a grid of 4 km^2 (2 km x 2 km) blocks was superimposed on a digital bathymetric model of the survey area. The average depth was computed for each block and stratum membership assigned. Blocks were then selected at random within strata based on the allocation scheme. Blocks that fell within rockfish conservation areas (RCAs) or enclosed waters, were eliminated from the initial set. A geographic information system (GIS, ArcMap 9.0) was used to design and then manage the survey.

Adopting the strategy developed for the Queen Charlotte Sound survey in 2005 a complete set of potential survey blocks was selected prior to departure (Olsen et al, 2007c). Based on the observed rejection or failure rate of 28 % observed during the 2004 survey of this area we estimated that approximately 252 randomly selected blocks would be need to achieve the target of 170 – 180 usable tows.

FISHING OPERATIONS

Fishing operations were the same as those described by Workman et al., 2007. Fishing commenced at 07:00 and ended around 20:00, this was in accordance with the vessels lay-day schedule. Catch processing and biological sampling often continued for several hours afterwards resulting in an average 14 hour work day for the science crew aboard the vessel.

Each evening, the fishing master and chief scientist would review a map of the remaining blocks and select a subset to examine the following day. Sets of blocks were selected to minimize run time between locations, mix anticipated catch levels throughout the day, and end near a CTD station. If in the opinion of the fishing master or a consultant fisherman a block was un-fishable it was rejected.

If a selected block was known to be fishable by either the fishing master or consultant fisherman fishing commenced immediately upon arrival at the location. If unfamiliar to either, the block was inspected for half and hour to an hour using the depth sounder. If no tow location could be found, the block was rejected and the vessel moved on to the next block.

Target tow duration was 20 minutes on bottom. Start and end times were determined by monitoring the net mensuration sensor outputs. Once the head rope height

had collapsed to 3-4 m we concluded that the gear had "settled", was fishing, and started the tow timer. After 19 minutes the fishing master was directed to start retrieving the net, due to "lift off lag" this generally resulted in about a 20 minute tow.

Target tow speed was 2.8 knots (5.2 km/h) over the ground throughout the survey.

The scope ratio used (ratio of trawl warp length to depth) was at the discretion of the fishing master.

Tows were classified as usable if they met three criteria;

- minimum of 15 minutes of good bottom contact;
- during daylight hours;
- at least half the tow had to be inside the selected survey block.

In general, if the net hung up during a tow it would be classified as unusable, however, if the net was retrieved quickly, without significant damage and had a minimum 15 minutes of bottom contact, the tow could be considered usable as long as the chief scientist and fishing master agreed.

CREW AND ITINERARY

Science compliment and itinerary are presented Table 5 and Table 6 respectively. The vessel departed Nanaimo on May 23rd ; science crew changes occurred on June 2nd and June 11th; and returned to Nanaimo June 19th. Science compliment was 8 for the first leg, 9 for the second, and 8 for the third. Included in the science compliment was an oceanographer for the first two legs and a consultant fisherman for the duration.

BRIDGE LOGGING

Throughout the survey the Chief Scientist and the mate on watch were jointly responsible for maintaining a record of all significant events occurring aboard the vessel. This not only included collecting data relevant to the survey but also keeping a record of any injuries, equipment problems, gear failures or damage, personnel issues, an itinerary of ports of call, and staffing changes. For every bottom trawl tow the chief scientist completed a groundfish "Bridge log" data form recording the tow and block numbers as well as detailed time, location, depth, environmental data and whether or not the tow was usable.

In addition to the paper record, a continuous electronic record of the ships position, navigational data, sea surface temperature and salinity and SIMRAD ITI net mensuratiom data were logged by a laptop connected to the ships network using NOAAs SCS (Scientific computing system) software. A second electronic record of each trawl track was recorded by the fishing master on the ships computer using Nobeltec™ version 6.0 navigation software. In addition to these records an "Electronic Bridge log form" was completed during each tow, the Electronic bridge log was designed as a front end to our field data base, **GFBioField**. **GFBioField** is used to enter data manually, off paper data forms, following each survey; once data are proofed they are uploaded from **GFBioField** to Pacific Region's corporate Groundfish biological database, **GFBio**. The form was designed to capture NMEA083 standard electronic data from the GPS and depth sounder to populate fields in the data base.

CATCH PROCESSING

At the end of each tow, the net was retrieved and the catch dumped into a hopper in the fish processing lab. Catch was sorted by species into separate baskets as it moved along a conveyor system. Catches in excess of 2000 kg were sub-sampled for species composition by selecting 5 baskets from the beginning, middle and end of the catch and weighing the rest of the unsorted catch in baskets. Baskets in the sub-sample were then dumped onto the conveyor and sorted to species; species proportions in the sub-sample were then applied to the unsorted catch weight. Several large conspicuous species (lingcod, halibut, skate, or pacific cod) were removed completely from these larger catches. This made it crucial to record the catch sorting method for each species to ensure they were not included in the calculation of species proportions for the unsorted catch.

Baskets were weighed to the nearest 0.1 kg using a large capacity, motion-compensating electronic balance (Marel Model M1100/M2000, 60 kg capacity). Weights were recorded on standard groundfish catch composition forms. Disposition of each basket of catch was also recorded on the catch composition form to provide cross validation of sampled species. Small catches were on occasion weighed using a smaller top - loading motion compensating balance (Marel Model 2200, 6 kg capacity). For small catches the number of individuals was often recorded as well as the weight.

Catch was sorted to lowest taxon possible. For most fishes this was to the level of species; invertebrates, however, were often only keyed to phylum or order.

Catch from unusable tows was neither sorted nor biologically sampled.

BIOLOGICAL SAMPLING

Length by sex frequency samples were collected from all species in every catch as long as they met the minimum samples size requirement and sampling frequency requirement outlined in Table 7; frequently encountered species were only sampled every second, third or fourth tow to free up additional sampler time for other less common species. Complete biological samples including length, sex, weight, maturity and an ageing structure were collected from the dominant species in the catch, a length, sex, weight sample was collected from the next most dominant species. When nearing the target of 300 ageing structures for a particular species sampling effort was transferred to less common species. Several species were preferentially sampled including several species of rockfish, skates, Pacific cod, and lingcod, see Table 8 for details.

Length and length/sex samples were collected using tally strips recorded to the nearest centimetre. Counts at length (and sex) were then transcribed to groundfish length frequency data forms; sample weights (by sex) were also recorded.

During complete biological sampling, length was determined to the nearest millimetre, weight to the nearest gram, and maturity to the nearest stage as defined in Appendix 1. Data for each specimen was recorded on standard “Card 04 – Biological Sampling” forms. Otoliths were collected for ageing rockfish and flatfish, second dorsal fin rays for lingcod and Pacific cod and right pectoral fins for pollock. Otoliths were cleaned and stored in “Tray Bien” otolith trays in a 50:50 solution of glycerine/water with 1 g thymol added per litre. For lingcod, rays 4 -10 of the second dorsal fin were collected, for Pacific cod the first 10 rays of the second dorsal fin, and for walleye pollock the entire right pectoral fin. Fins were collected in labelled coin envelopes with

the meaty part of the fin projecting. Envelopes from the same sample were bundled together and stored frozen until dried for processing.

OCEANOGRAPHIC DATA

Throughout the survey, CTD (Conductivity, Temperature and Depth) casts were performed at established "La Perouse Project" stations during the night. Once fishing operations ceased the vessel would immediately proceed to the nearest CTD transect line and commence CTD casts. In general one transect was completed per night. Casts were performed using a SeaBird SBE 911 guild-line CTD.

A captive thermosalinograph (SeaBird SBE 21) installed in the hull of the WE RICKER recorded continuous position, sea surface temperature and salinity data throughout the survey.

BIOMASS INDEX

The biomass index of fish species captured in the survey was obtained by multiplying the mean catch density per stratum by the area in each stratum and summing over all strata:

$$B = \sum_{i=1}^{k} C_i A_i = \sum_{i=1}^{k} B_i$$

where C_i = mean catch density (kg/km^2) for species *s* in stratum *i*.

A_i = area of stratum *i* (km^2).

B_i = biomass of species *s* in stratum *i*.

k = number of strata.

The mean catch density (C_i) in each stratum was calculated by:

$$C_i = \frac{\sum_{j=1}^{n_i} \left(W_j \middle/ D_j w_j \right)}{n_i}$$

where W_j = catch weight (kg) of tow *j* in stratum *i*.

D_j = length (km) of tow *j* in stratum *i*.

w_j = mean net width (doorspread; km) of tow *j* in stratum *i*.

n_i = number of tows in stratum *i*.

One thousand bootstrap replicates with replacement were performed on the survey data to estimate bias corrected 95% confidence limits and relative error for each biomass estimate, with relative error defined as the coefficient of variation (CV) of the distribution of the 1000 boot strapped estimates.

RESULTS

FISHING OPERATIONS

From a total of 28 vessel days, 2 days were required to load and offload the vessel at the start and end of the survey, one day was required to travel to and from the grounds, a half day each way, and an additional day and a half was lost to science crew changes (Table 5). No days were lost due to weather or equipment failures (Table 6). This resulted in 23.5 days of actual fishing time during which a total of 176 trawl sets were completed. Of these, 165 were successful while 11 failed due to fouled gear or a lack of bottom time. This resulted in an average of 7.0 successful tows per fishing day.

In total all 252 survey blocks were either fished or inspected. Table 4 summarizes the results by selection and final status. Thirty nine blocks were rejected on the basis of prior knowledge, 37 were rejected after an on grounds inspection, and 11 were rejected after failed fishing attempts. One hundred and 165 blocks were fished successfully on the first attempt, no blocks were fished successfully after an initial failure. This resulted in a final status of 165 successfully fished survey blocks and 87 rejected blocks. Figure 4 shows the final status of survey blocks. Figure 5 to Figure 8 show plots of individual trawl tracks; red blocks with no trawl track were rejected on the basis of prior knowledge or an inspection; green blocks were fished successfully on the first attempt. Again, as in 2004, there are several tows that were classified as successful (Usable) even though half the trawl track was not within the block. By the rules outlined above these blocks should have been rejected. However, one must be somewhat pragmatic given the limited vessel and personnel resources available, so following each tow the chief scientist and fishing master determined the reason(s) for the tow occurring outside the block, and if it could be clearly determined that either current, weather, or a misjudgment in timing was the cause, that tow was retained as usable.

Appendix 2 lists details for each trawl tow including time, position, depth, duration, speed, direction of the set, block number, total catch weight and whether or not the tow was usable.

CATCH

A total of 117,638 kg of mixed fish and invertebrates were caught during the survey. By species group the catch was dominated by rockfish which accounted for 35 % of the total catch weight, flatfish and cartilaginous fishes each accounted for 28 % of the catch while round fish only accounted for 8 % of the catch (Table 9). Seventy five percent of the catch by weight was comprised of the following nine species: spiny dogfish, arrowtooth flounder, canary rockfish, Pacific ocean perch, yellowtail rockfish, sablefish, splitnose rockfish, Dover sole, and sharpchin rockfish (Table 10). The most common species were rex sole and spiny dogfish occurring in 91 % and 85 % of tows. Fragile urchin was both the most abundant and most common invertebrate encountered. Species catches by tow are presented in Appendix 3.

Mean catch weight per usable tows was 710 kg, while median catch weight was 399 kg. Five percent of tows caught less than 50 kg, 5 % of tows were larger than 1,000 kg, and 90 % of tows weighed between 50 and 1,000 kg (Figure 9).

On average 19 species were recorded per tow with a maximum of 35. Of 168 unique identifications made in the field 130 of these are to the level of genus and species (Appendix 4). One hundred fish species were identified (Table 9) including 30 rockfish, 13 flatfish, and 6 elasmobranches. Sixty five invertebrate species groups were identified. Invertebrates were recoded from 145 of 165 sets, averaging 3 species per tow with a maximum of 8.

Maps of catch for the dominant species encountered are presented in Figure 10 to Figure 19. The circles are scaled to the total catch weight, and all species are presented on the same scale.

BIOMASS INDICES

Biomass indices have been generated for the species with total catch weights greater than 25 kg and are presented in Table 10. When interpreting these indices it is important to remember that they are relative and are being presented here to facilitate comparisons between survey areas and survey years. These indices should not be interpreted as estimates of population biomass because the numbers can be changed dramatically by changing either the estimate of habitat area or the method used to determine the area swept by the trawl.

Area swept is determined by multiplying the effective path width of the net by the distance towed. Effective path width is in fact, a pragmatic choice, it is the distance between the trawl doors, the distance between the wingtips of the net or possibly something in between like the distance between the leading ends of the lower bridle. If you believe the species for which you are computing a biomass index is effectively herded by the sweep wires or bridles your preference would be to use door or bridle spread, if on the other hand you believe no herding takes place then you'd simply use the wingtip spread. The standardized approach to all species taken here is to use trawl door spread as the effective path width. Distance towed was determined in one of two ways. For tows with available bottom contact data we used the start and end bottom contact times to determine start and end positions in the GPS track line data and integrated the distances between all observed positions during the tow. For tows without bottom contact data we used the mean vessel speed during the tow and tow duration to calculate distance towed.

As stated earlier in the report, habitat area was computed using a GIS and included all the area of each depth stratum within the survey area excluding only enclosed waters and rockfish conservation areas. It is likely that this grossly overestimates the true habitat for a given species due to each species preference for a particular substrate and topography, after all a sole is unlikely to live on a rocky reef and a rockfish is unlikely to be found on a flat sandy bottom. Future indices might be computed using more complex species specific estimates of habitat derived from habitat models that incorporate factors such as substrate type, relative slope, hardness, currents or water properties (oxygen, pH). Until these become available the generalized estimates derived here will be used.

Species with the highest biomass indices were: spiny dogfish, arrowtooth flounder, canary rockfish, Pacific ocean perch, yellowtail rockfish, and sablefish. Species with the most precise indices, or lowest relative error, included Dover sole, rex sole,

longnose skate, lingcod, English sole and petrale sole. With 165 usable tows, 14 species were below the target relative error of 0.2, 10 species were between 0.2 and 0.3, and another 11 species fell between 0.3 and 0.5. One of the design objectives of this series of surveys is for each area specific survey to generate 20 or more biomass indices with relative errors of less than 0.2, this survey nearly achieved that goal with 20 species having REs of less than 0.25.

BIOLOGICAL DATA

A total of 1,230 samples comprising 31,599 specimens across 60 species were sampled and 7,112 ageing structures were collected from 32 species. Table 11 catalogues the attributes collected by species, Table 12 lists the sample types by species and Table 13 summarizes length, weight and sex proportions by species.

GEAR PERFORMANCE DATA

Table 14 lists vessel, environmental and gear performance data collected during the survey. Global positioning system (GPS) latitude and longitude were recorded during 162 of 165 usable tows. Seabird SBE 39 temperature and depth data were recorded for 165 sets while bottom contact data is available for 163 sets. An example SBE 39 temperature depth profile is presented in Figure 20. Two example bottom contact traces from the NMFS BCS are presented; Figure 21 shows a trace while fishing on smooth mud or sand bottom while Figure 22 shows a trace on rougher bottom.

Mean vessel speed while fishing (during usable sets) ranged from 4.3 km/h to 7.0 km/h, with a mean of 5.49 km/h.

SIMRAD ITI data on net height and door spread and net depth were recorded both electronically and manually throughout the survey. Electronically logged door spread data are available for 137 sets, net height data is available for 135 sets. Mean door spread was 62.7 m (41.4 – 71.8 m) mean net height was 3.7 m (2.2 – 6.6) and wingtip spread for which there was only 2 measurements made was 13.2 m. Due to concerns over the downward herding effect of the third wire used in 2004 it was not employed during this survey.

The relationship between warp length and bottom depth is plotted in Figure 23. The scope ratio ranged from 1.8 to 4.0 with a mean of 2.7. In general the scope ratio selected by the fishing master decreased as depth increased (Figure 24) although on many occasions when the bottom topography was rough a lower scope ratio was used to reduce the likelihood of hanging up. As depth increased variability in scope ratio decreased, note in Figure 25 the wide range of scope ratios employed in relatively shallow depths.

Appendix 5 lists mean sensor data by set.

OCEANOGRAPHIC DATA

CTD casts were performed at 91 established “La Perouse Project” stations (Figure 26). Dissolved oxygen, salinity, temperature and depth were recorded during 152 of 165 sets using a net mounted SeaBird SBE 16+ CTD. This was the first instance of this application for this device in the Pacific region. An example plot is presented in Figure 27, note the differences in water properties between the deployment (downcast) and

retrieval (upcast) of the net and the variability in water properties while towing. It is postulated that over time these data will help explain some of the inter-annual variation in species abundance indices and distributions. Both SEB 911 and SBE 16 + data have been processed by staff at the Institute of Ocean Sciences, Sidney BC, and added to the oceanographic data archive (Mr Robin Brown, Custodian). Captive thermosalinograph (sea surface temperature and salinity) is available from 158 of 165 usable tows and data have been incorporated into the groundfish surveys database.

CONCLUSIONS - RECOMMENDATIONS

- During future WCVI surveys the number of usable tows must be maintained at ~ 170 to come close to generating adequately precise abundance indices for most of the major commercial species;
- As recommended in 2004 the depth range for this survey should be increased to at least 1200 m for 2008, however this must be done without loss of sampling effort in the 50 – 500 m depth range;
- Progress has been made in identifying un-trawlable bottom, as a consequence significantly less gear damage was sustained during the 2006 survey than during the 2004 survey additional efficiencies may be achieved by further reviewing the survey design with commercial fishers and the vessels fishing master;
- All future surveys should continue to collect in situ oceanographic data;
- Refinement of the biological sampling protocol has effectively transferred sampling effort to less common species while ensuring adequate sampling of the dominant species in the catch.
- Additional resources must be invested in automated data collection systems to improve efficiency and reduce recording errors.

ACKNOWLEDGEMENTS

The officers and crew of the WE RICKER are to be commended for their service during this survey. Fishing and oceanographic vessel handling was accurate and timely, fishing gear was handled in a professional manner and repairs were made quickly; the engineering staff ensured all vessels systems were operational and addressed defects in a timely manner, the galley staff ensured all science crew were comfortable and their personal needs addressed. The Canadian Groundfish Research and Conservation Society, in particular Mr Bruce Turris, was very helpful in providing the trawl nets for the survey and contracted Captain Gary Sigmund as the consultant fisherman for the survey. Mrs. Karina Cooke must be thanked for her thorough review of the transcript.

TABLES

Table 1: Mean annual observed bottom trawl catch coastwide and for the west coast of Vancouver Island (retained + discarded) in metric tones, as well as the proportion of the coastwide catch which is taken off the WCVI. Listed are the 27 species which comprise 95 % of the catch off the WCVI.

Common Name	Coast wide	WCVI	Proportion of coast wide catch
Arrowtooth flounder	8611	3436	40%
Dover sole	3060	1351	44%
Yellowtail rockfish	1982	859	43%
Lingcod	1552	705	45%
Spiny dogfish	1294	651	50%
Longspine thornyhead	672	580	86%
Pacific ocean perch	5752	503	9%
Canary rockfish	714	425	60%
Pacific hake	514	398	77%
Sablefish	657	392	60%
Shortspine thornyhead	616	349	57%
Petrale sole	445	252	57%
Redstripe rockfish	883	231	26%
Silvergray rockfish	1139	229	20%
Yellowmouth rockfish	2047	216	11%
Pacific cod	972	203	21%
Rougheye rockfish	561	141	25%
Rex sole	589	131	22%
Sharpchin rockfish	370	128	35%
Longnose skate	314	123	39%
Grenadiers	152	96	63%
Pacific halibut	474	94	20%
Spotted ratfish	724	93	13%
English sole	958	80	8%
Tanner crabs	83	79	95%
Bocaccio	175	57	33%
Widow rockfish	242	52	21%

Table 2: Specifications for the Atlantic Western IIa trawl net used as the primary survey trawl throughout the 2006 west coast Vancouver Island groundfish bottom trawl survey.

Part		Material
Rigging		
Doors	1135 kg each	USA Jet Model P
Door Legs	30’	¾” chain
Pickups	45’	⅞” cable
Sweep Line	90’	⅞” cable
Upper bridle	90’	¾” cable
Lower bridle	90’	⅞” cable
Net frame		
Headline	74’ 6”	11 mm long link chain and 1” poly steel rope
Headline floats	89	8" plastic Spheres (23, 13, 17, 13, 23)
Riblines	21’ 6”, 36’ 6”, 36’ 6”, 32’ 4”	1¼ " Polysteel rope in four sections, Taper, Intermediate x2, and Codend.
Bolsch Line	68’ 4”	1" poly steel rope
Fishing Line	68’ 4”	11 mm long link chain
Wing lines	22’ 3”	11 mm long link chain and 1 “ poly steel rope
Foot Rope		
Foot Rope	107’ 4”	½” Chain for bunt wing, mid wing and wing extensions, 3 lengths of ⅜“ chain in bosom sections joined with ½“ hammer locks.
Bosom section	14’	18” tires (24) spaced 6” on center with 3” rubber disks separating the tires, three lengths of ⅜” chain run the width of the section at 0, 120 and 240 degree angles when viewing the tire section on end, one ⅜” black shackle and one ½ “ anchor shackle on ⅜ “ chain lengths between every second tire to shackle onto fishing line.
Bunt Wing Section	18’	18" rock hopper, 18" disks (11) spaced 21" apart, 5” rubber disks between rock hopper disks, 5” Lancaster centered between rock hopper disks with a length of ⅜” chains hanging from the Lancaster
Mid Wing Section	8’ 8”	18" rock hopper, same as bunt section
Wing Extension	19’ 6”	5" packed rubber disks with 18" half egg at the front and a 18” half egg at the back of the section mounted on a three hole delta plate welded to a 1” steel shaft
Rock hopper line	8’8”, 18’, 18’, 8’ 8”	Gathered at quarters where joined to bosom, shackled to fishing line for bunt and mid wing sections.

Yellowmouth rockfish	All	1
Yellowtail rockfish	Every Second Set	10

Table 8: Biosample protocol for selected species.

Species	Rule
Pacific Cod	Length stratified L/S/W/second dorsal fin, one fish per cm by sex. Remaining Pacific cod, up to 100 total sample size, sampled for L/S/W.
Lingcod	If more than 10 Collect up to 50 fins, if less then L/S/W
Bocaccio	Total catch L/S/M/W/O, max. 100 per set.
Copper rockfish	Total catch L/S/M/W/O, max. 100 per set.
Darkblotched rockfish	Total catch L/S/M/W/O, max. 100 per set.
Quillback rockfish	Total catch L/S/M/W/O, max. 100 per set.
Redbanded rockfish	If catch > 5 pieces, Total catch L/S/M/W/O, max. 100 per set.
Shortraker Rockfish	Total catch L/S/M/W/O, max. 100 per set.
Yelloweye rockfish	Total catch L/S/M/W/O, max. 100 per set.
Petrale sole	Total catch L/S/M/W/O, max. 100 per set.
Rock sole	Total catch L/S/M/W/O, max. 100 per set.
All Skates	Total catch L/S
All others species of rockfish and flatfish	40 – 60 L/S/M/O/W per set if one of the dominant species in the catch with the overall objective of collecting ~ 300 otoliths per species over the course of the survey.

Table 9: Catch by species group

Species Category	Number of Taxa	Weight (Kg)
All Fish	100	117,840
Rockfish	30	41,674
Flatfish	13	32,935
Roundfish	8	9,914
Cartilaginous fish	6	33,084
Other fish	43	234
Invertebrates	65	487

Table 10: Catch by species for all (42) species with total catch weights in excess of 25 kg from usable tows. Listed are the frequency of occurrence, total catch weight, maximum and mean per-tow catch weight, and the relative biomass index in metric tones with its relative error.

Species	Number of Tows	Catch Weight (kg) Total	Maximum	Mean	Relative Abundance	CV
Spiny dogfish	139	29,465.6	11,053.0	212.0	26502	0.49
Arrowtooth flounder	129	19,222.2	1,796.9	149.0	9155	0.17

FIGURES

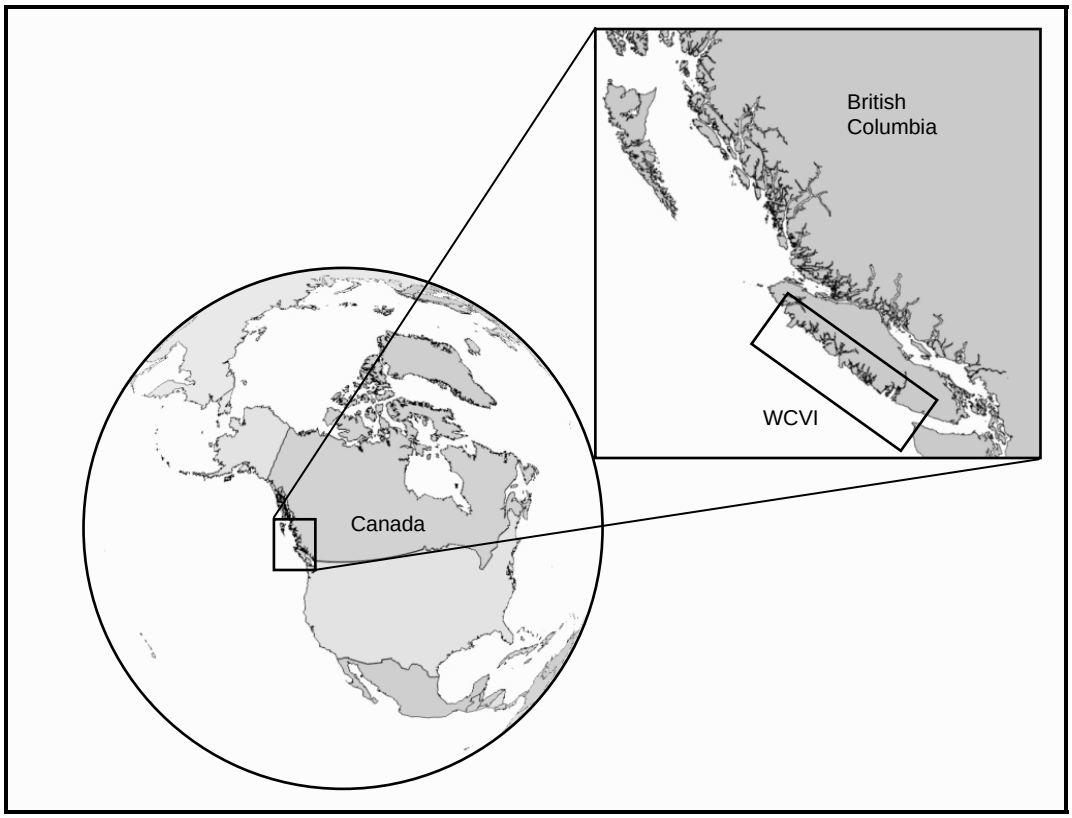

Figure 1: The location of the West Coast of Vancouver Island (inset, upper right frame) on the west coast of British Columbia, Canada.

Figure 2: The Government research trawler W.E. RICKER.

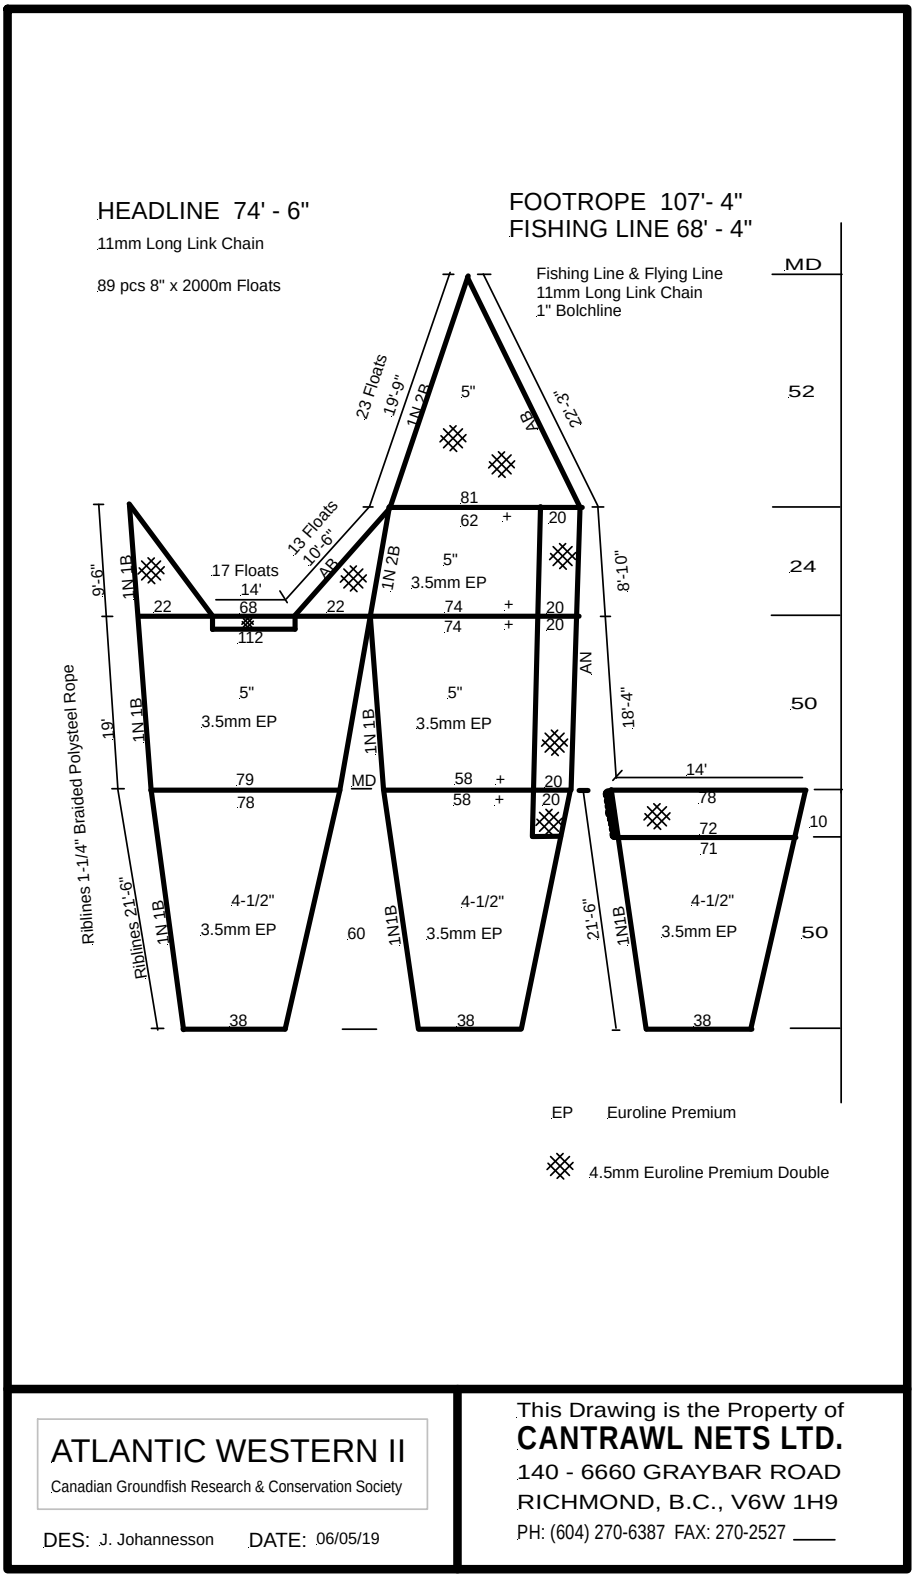

Figure 3: Atlantic western IIa used during the 2006 WCVI Bottom trawl survey.

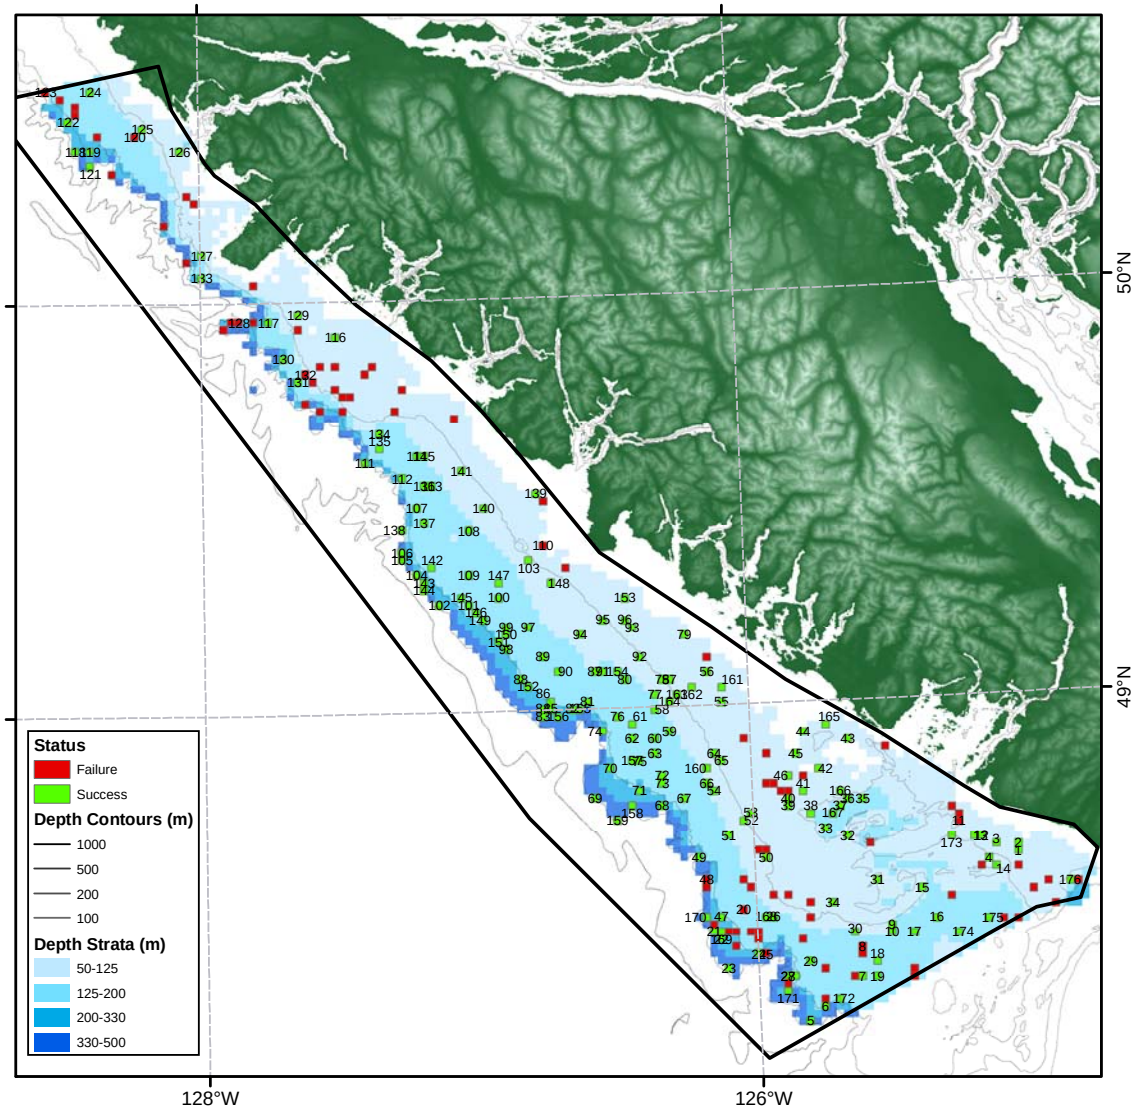

Figure 4: Map of the survey area off the West Coast of Vancouver Island. The thick black line outlines the survey frame; depth strata are represented by the four shades of blue; depth contours for 100, 200, 500, and 1000 m have been plotted. Survey blocks are shaded red or green depending on whether the site was successfully fished (green) or rejected (red), each block that was fished is labeled with its set number.

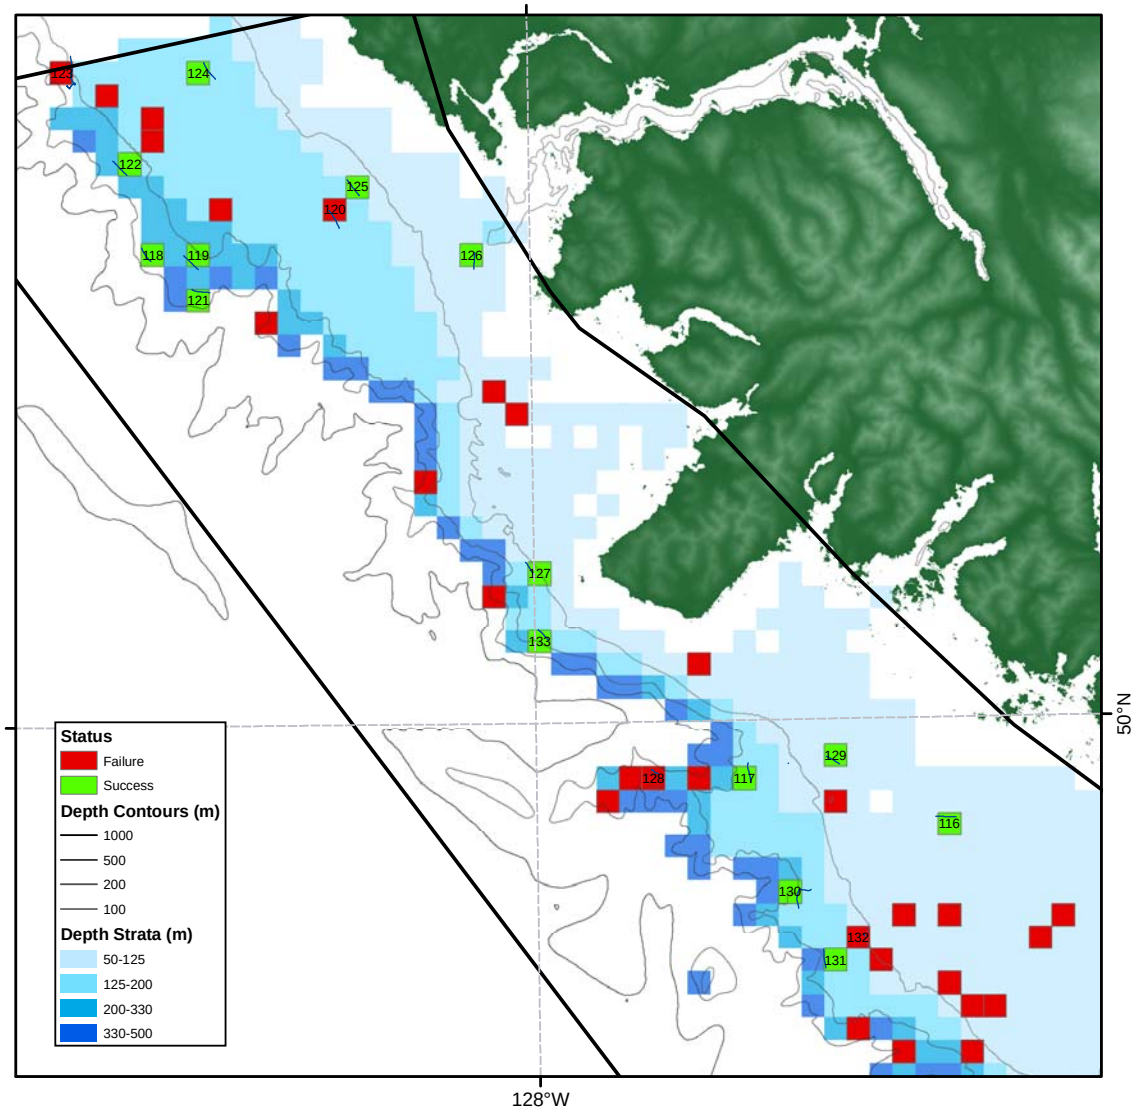

Figure 5: Detail view showing not only the blocks that were fished but also the track line of the tow, northern portion.

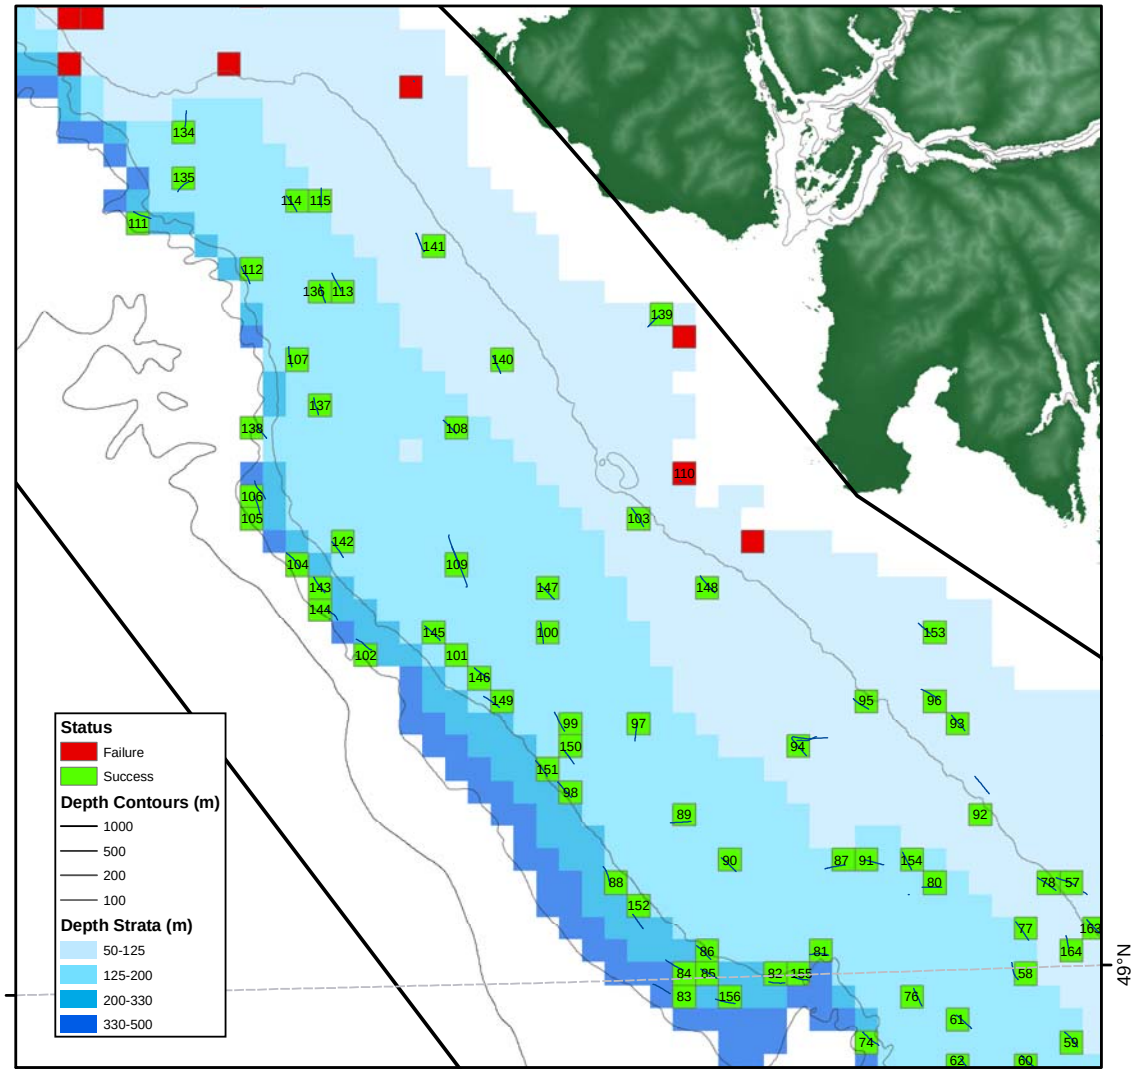

Figure 6: Detail view showing not only the blocks that were fished but also the track line of the tow, north central portion.

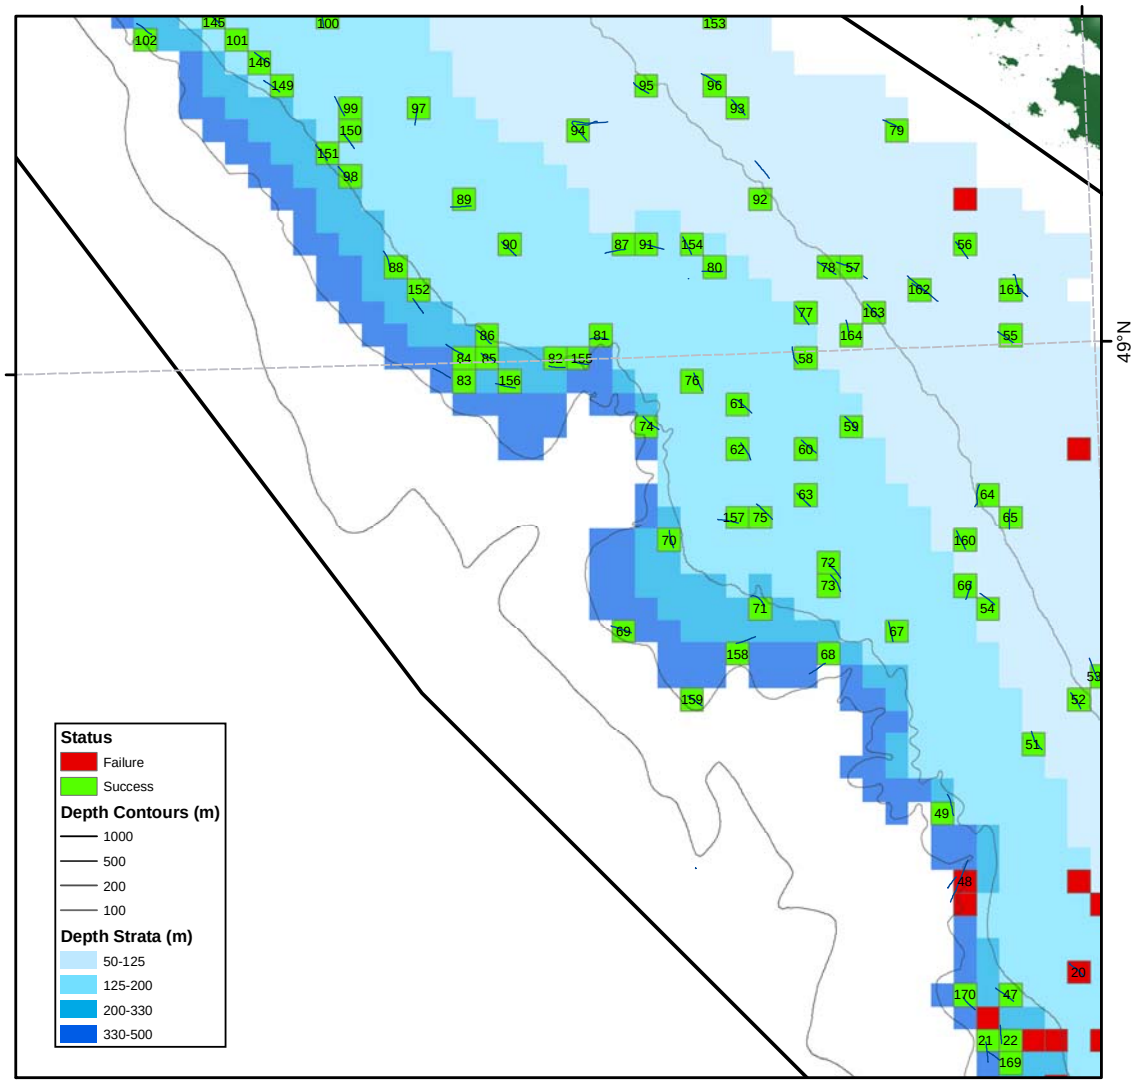

Figure 7: Detail view showing not only the blocks that were fished but also the track line of the tow, south central portion.

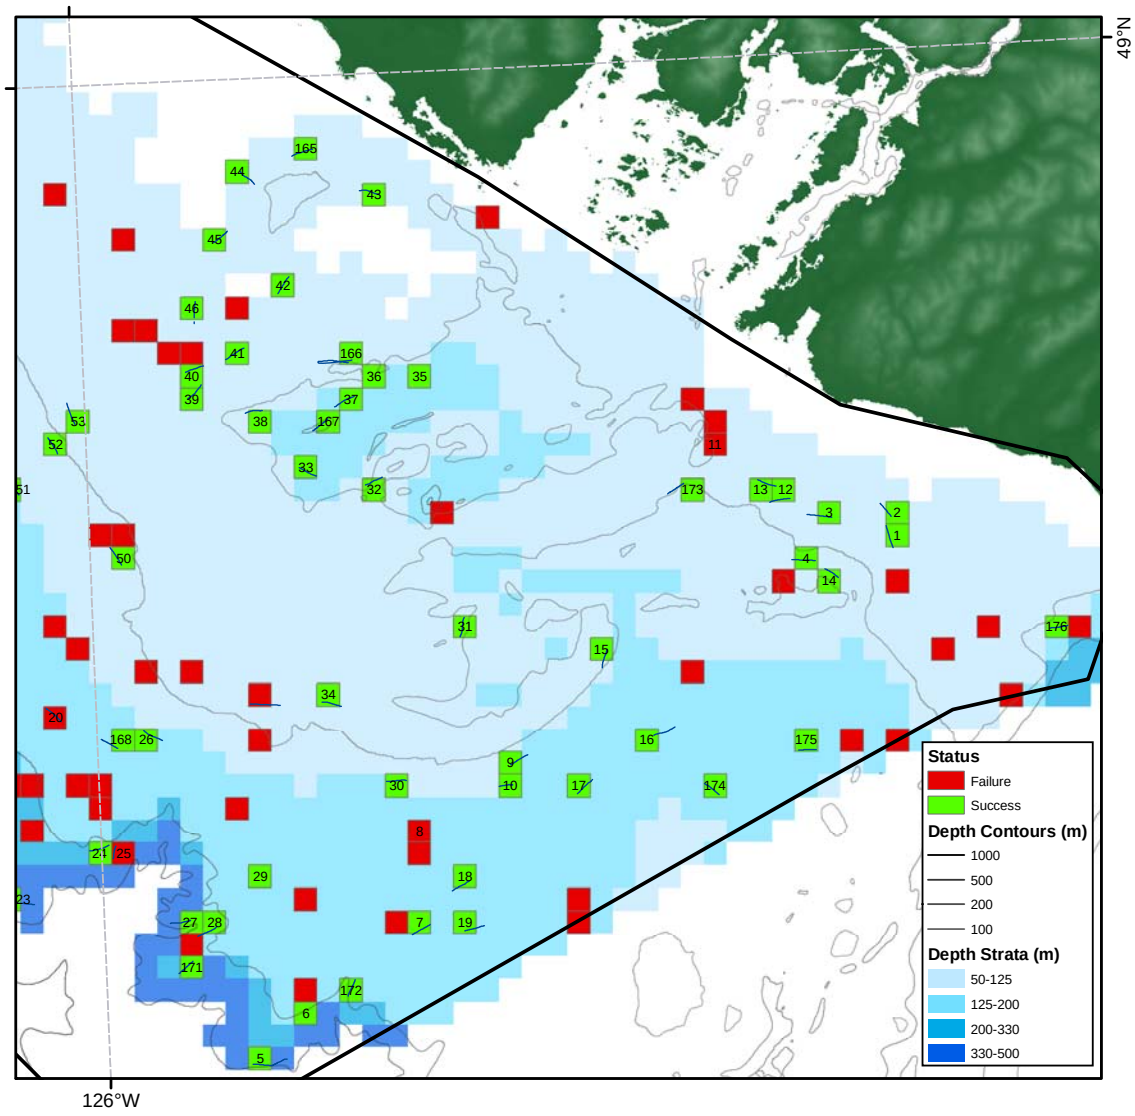

Figure 8: Detail view showing not only the blocks that were fished but also the track line of the tow, southern portion.

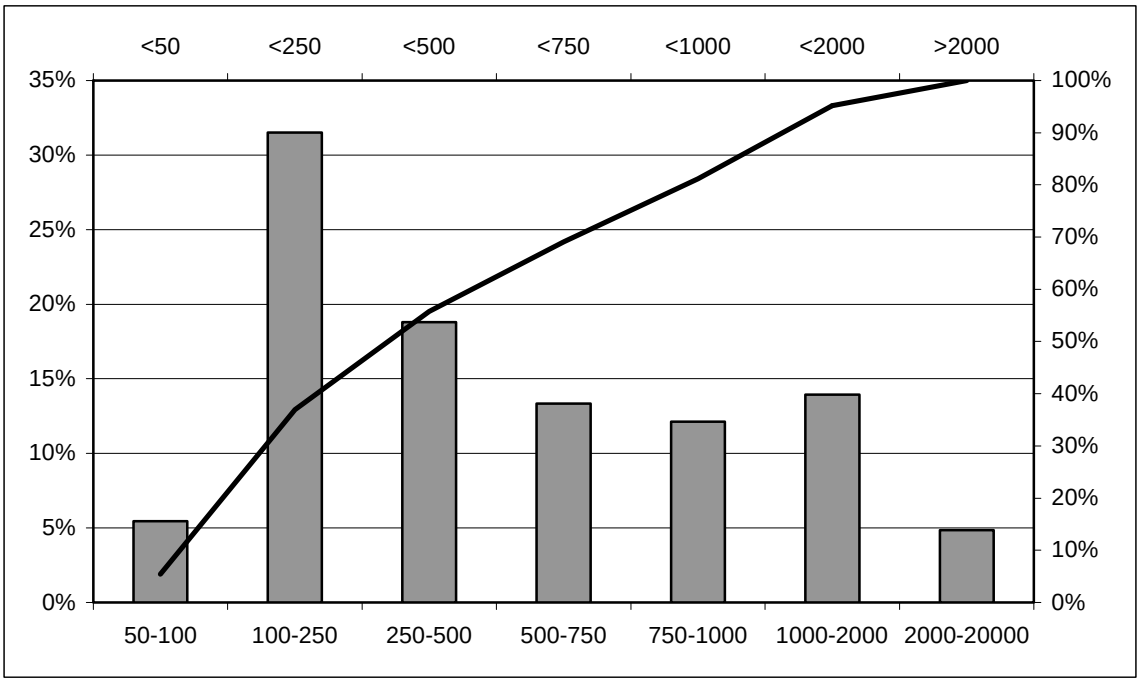

Figure 9: Distribution of catch size, bars represent the proportion (left y axis) of tows with a total catch weights by group (lower x axis). The line represents the cumulative catch proportion by the same bins plotted on the upper x axis and right y axis.

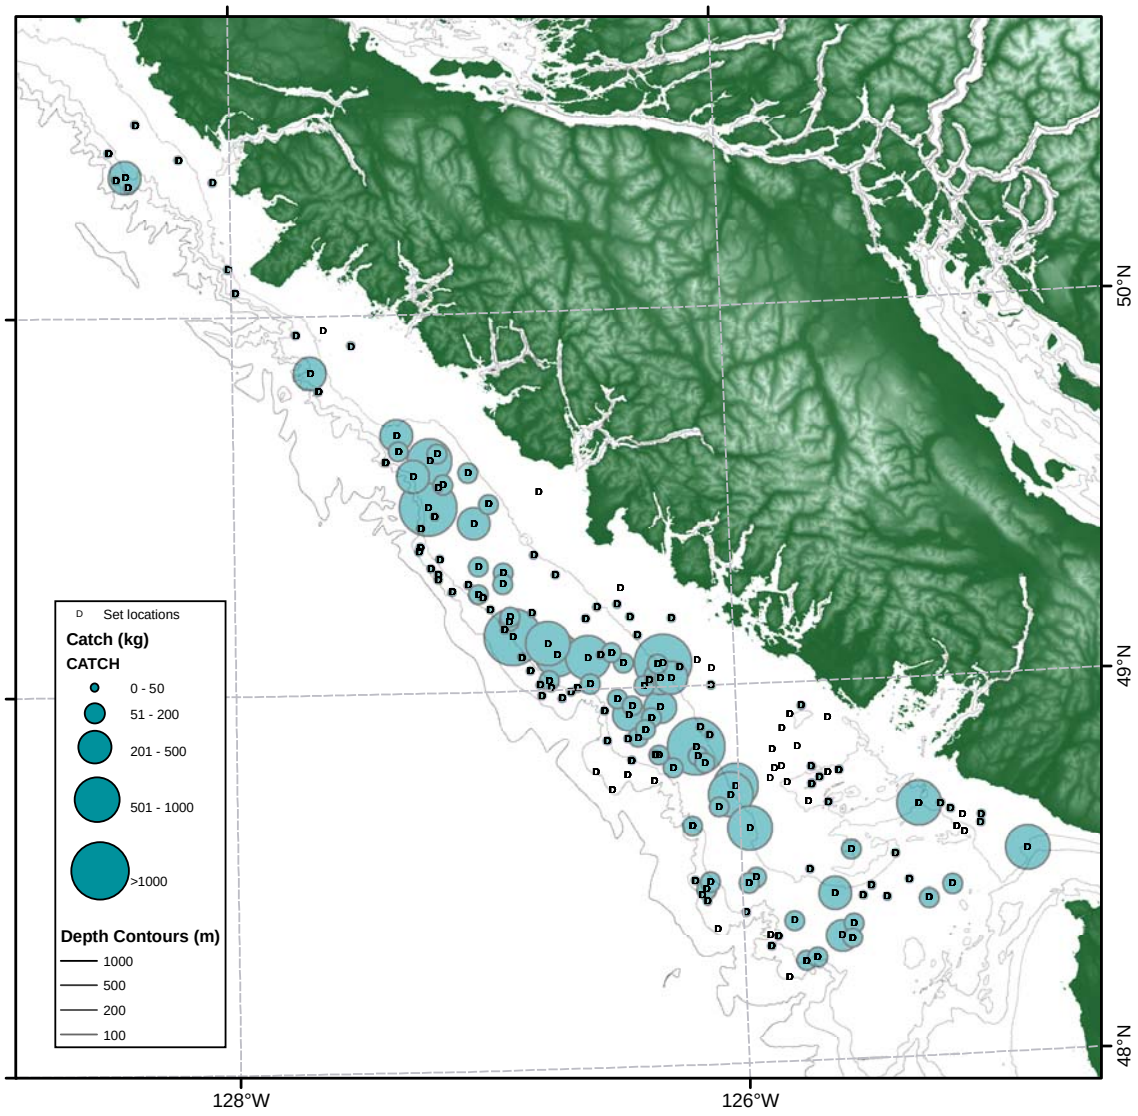

Figure 10: Distribution of spiny dogfish catches (kg), circles are scaled to catch size, sets with no catch are represented by the x symbol.

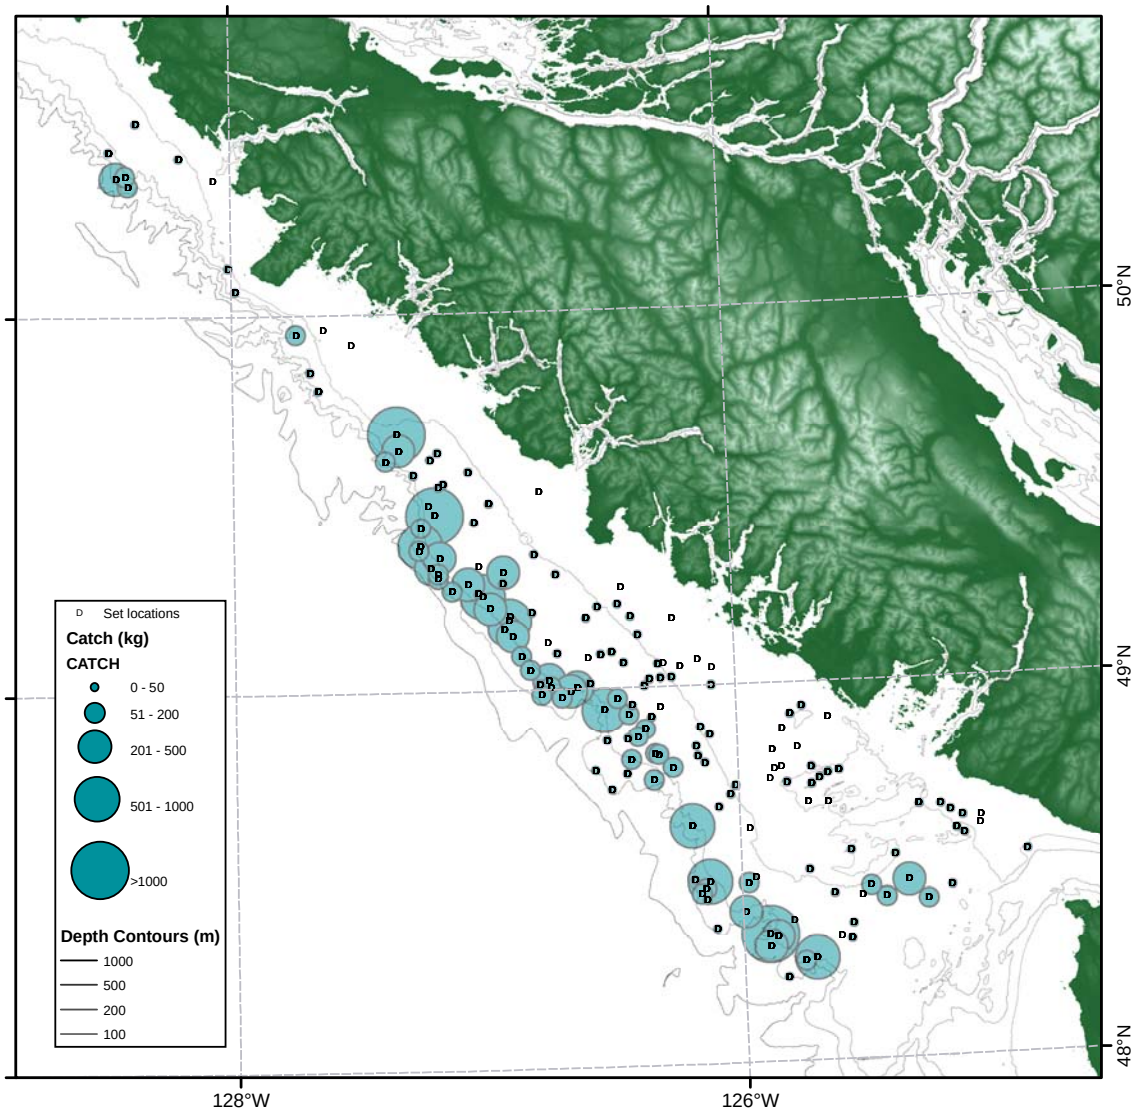

Figure 11: Distribution of arrowtooth flounder catches (kg), circles are scaled to catch size, sets with no catch are represented by the x symbol.

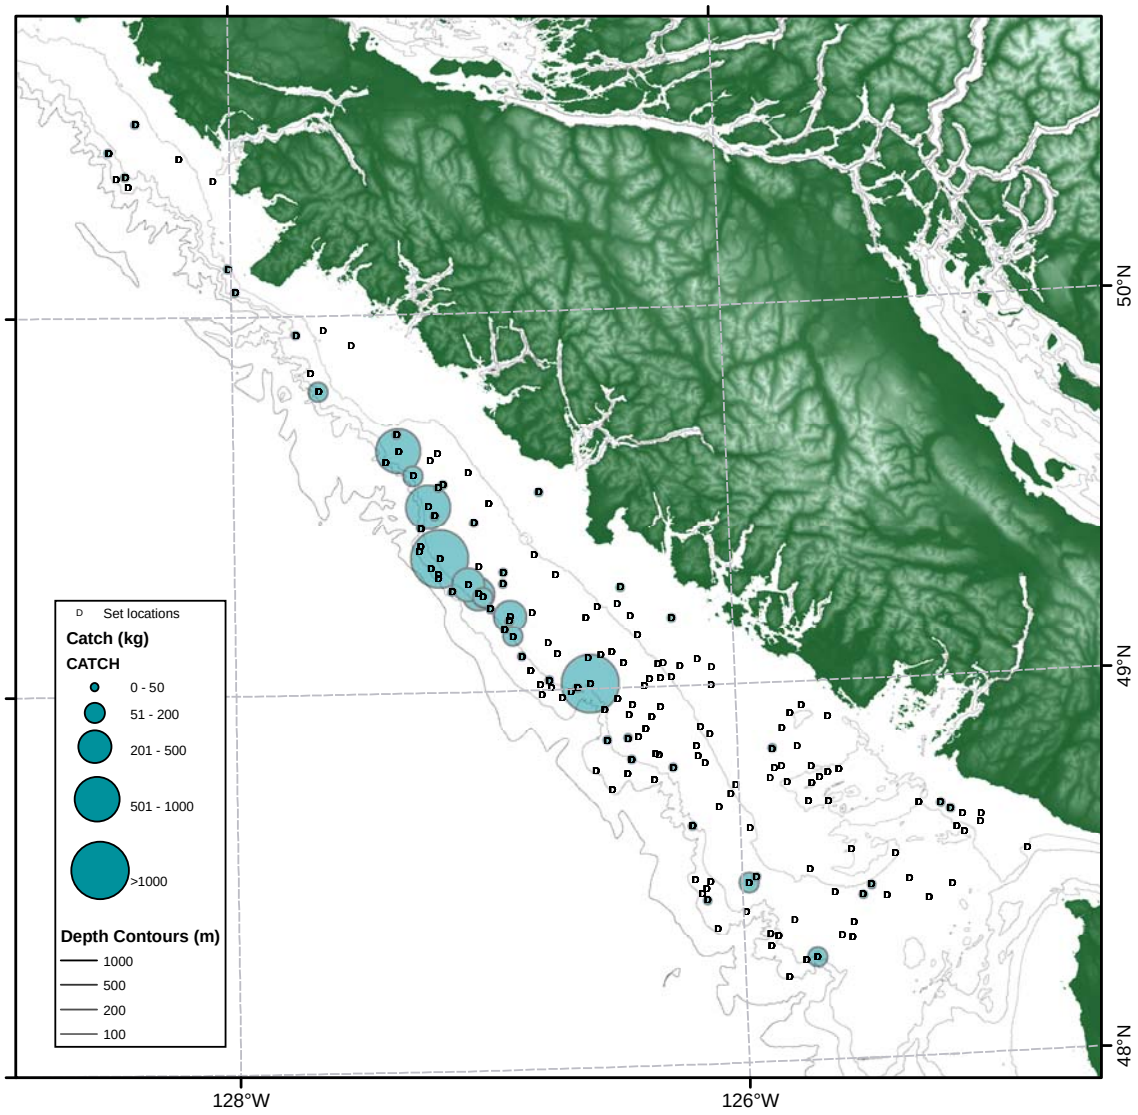

Figure 12: Distribution of Canary rockfish catches (kg), circles are scaled to catch size, sets with no catch are represented by the x symbol.

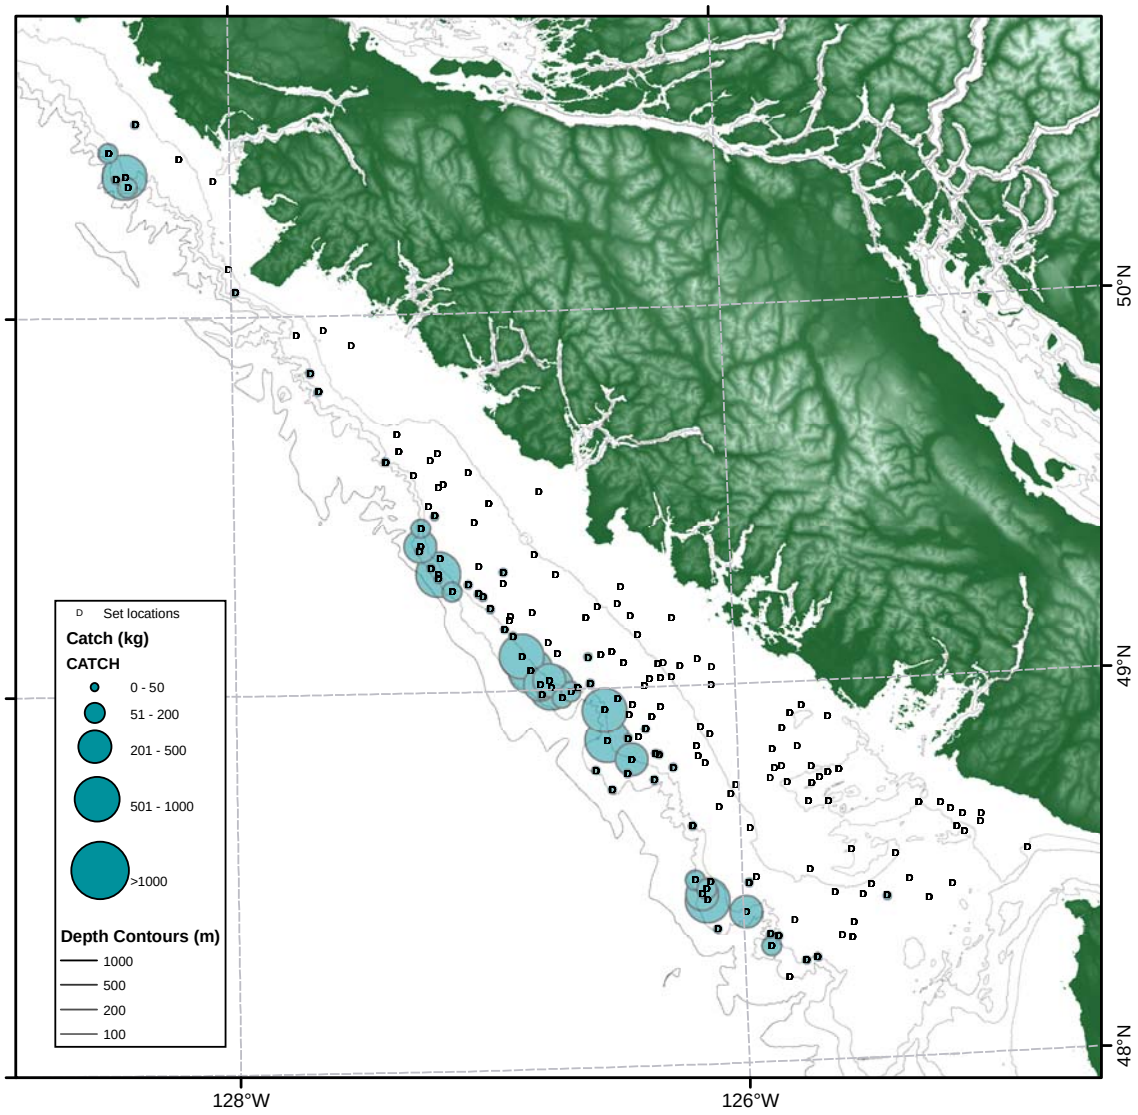

Figure 13: Distribution of Pacific Ocean perch catches (kg), circles are scaled to catch size, sets with no catch are represented by the x symbol.

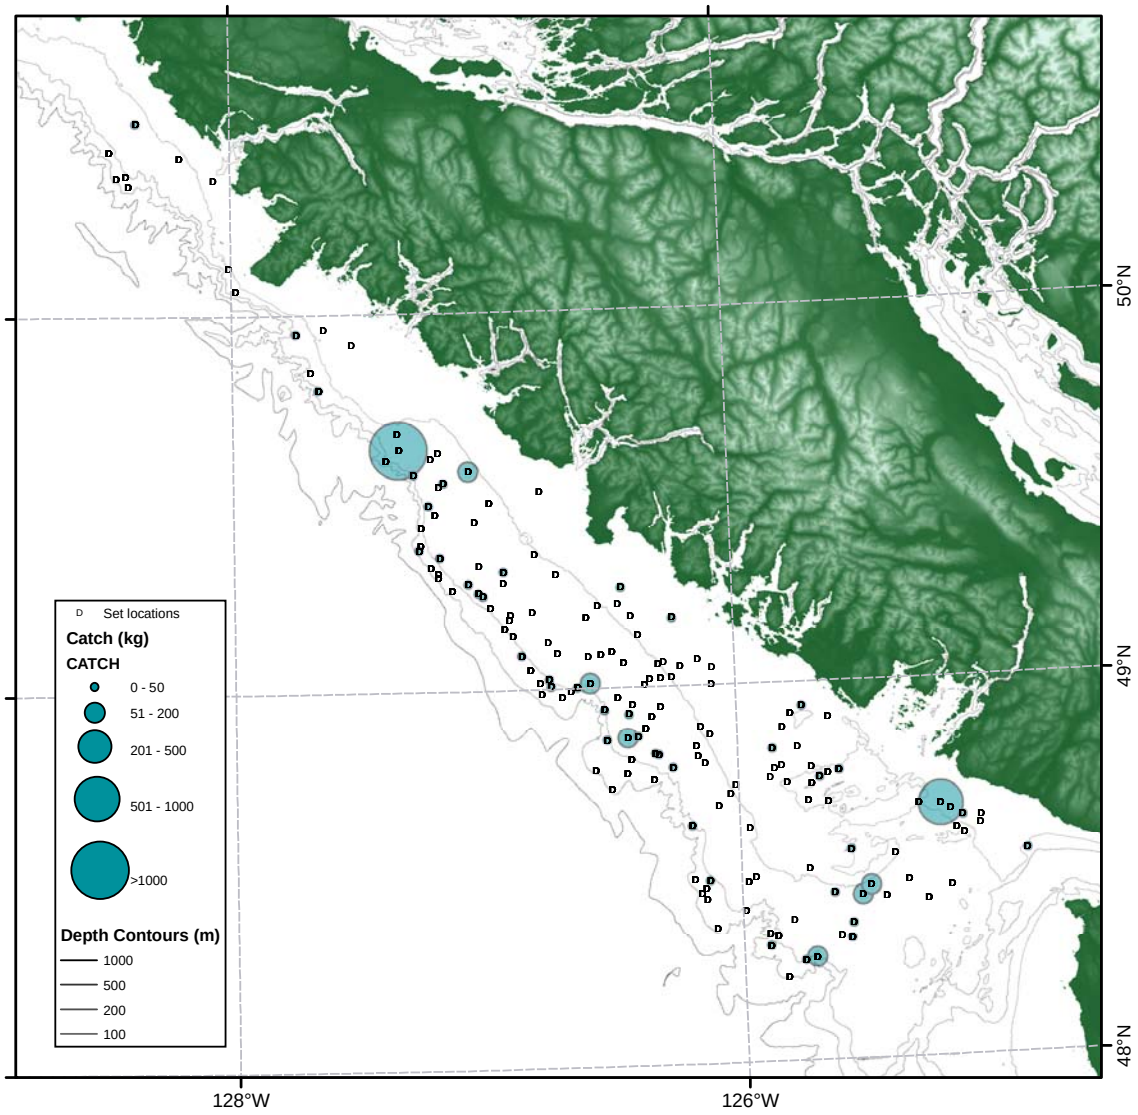

Figure 14: Distribution of Yellowtail rockfish catches (kg), circles are scaled to catch size, sets with no catch are represented by the x symbol.

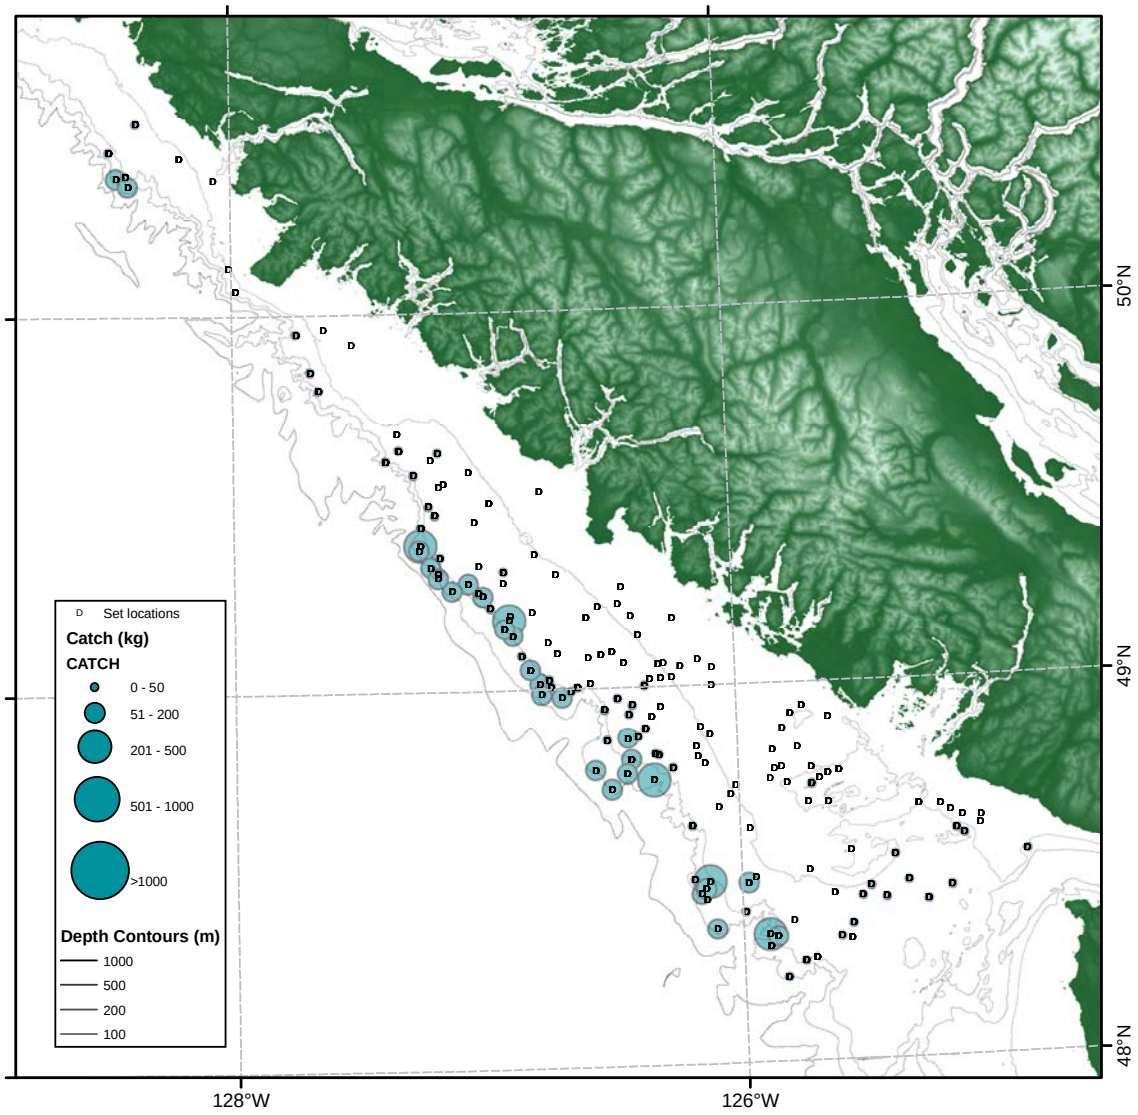

Figure 15: Distribution of sablefish catches (kg), circles are scaled to catch size, sets with no catch are represented by the x symbol.

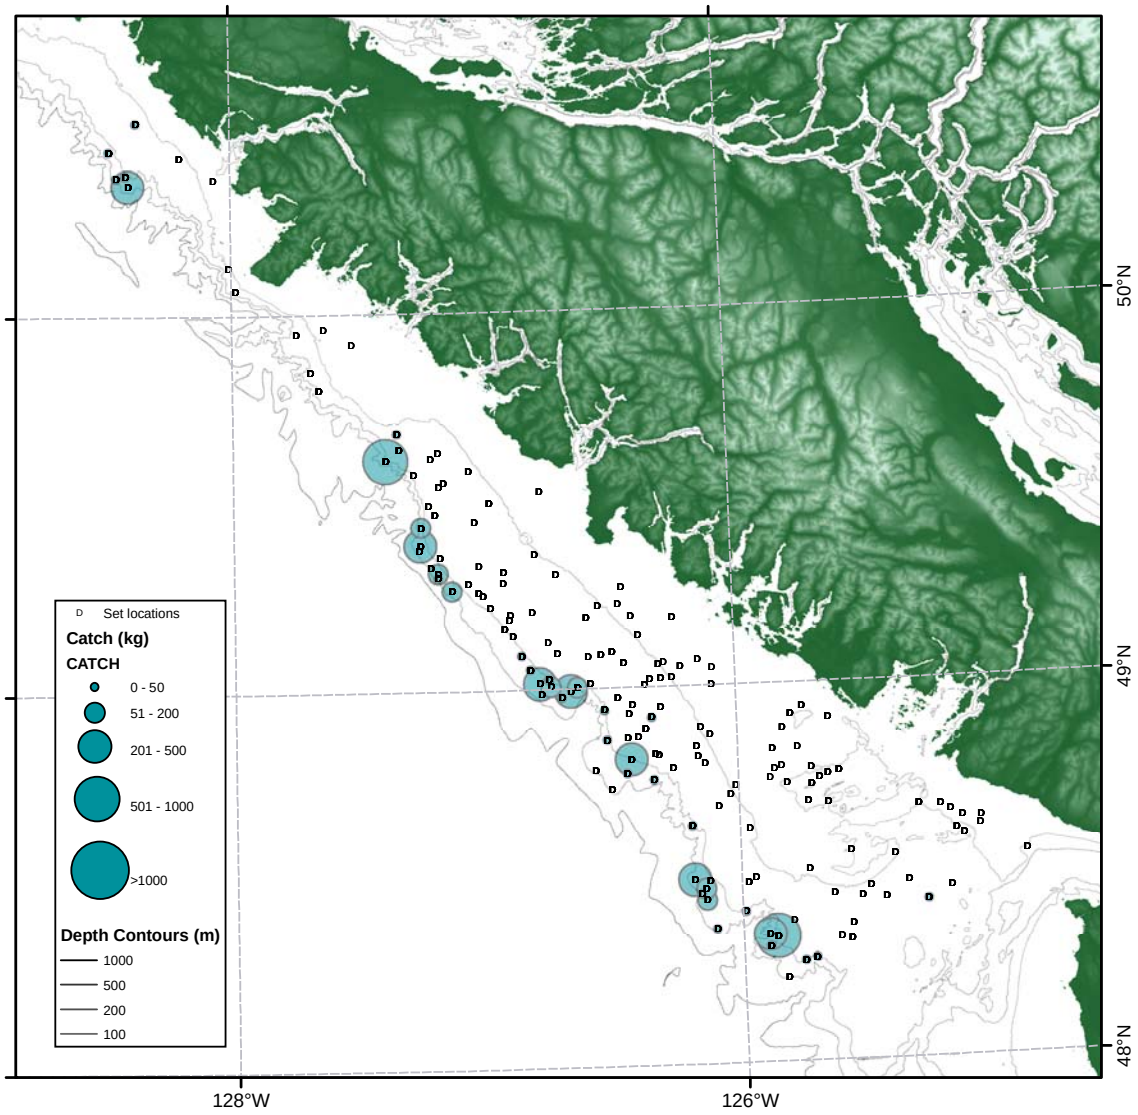

Figure 16: Distribution of Splitnose rockfish (kg), circles are scaled to catch size, sets with no catch are represented by the x symbol.

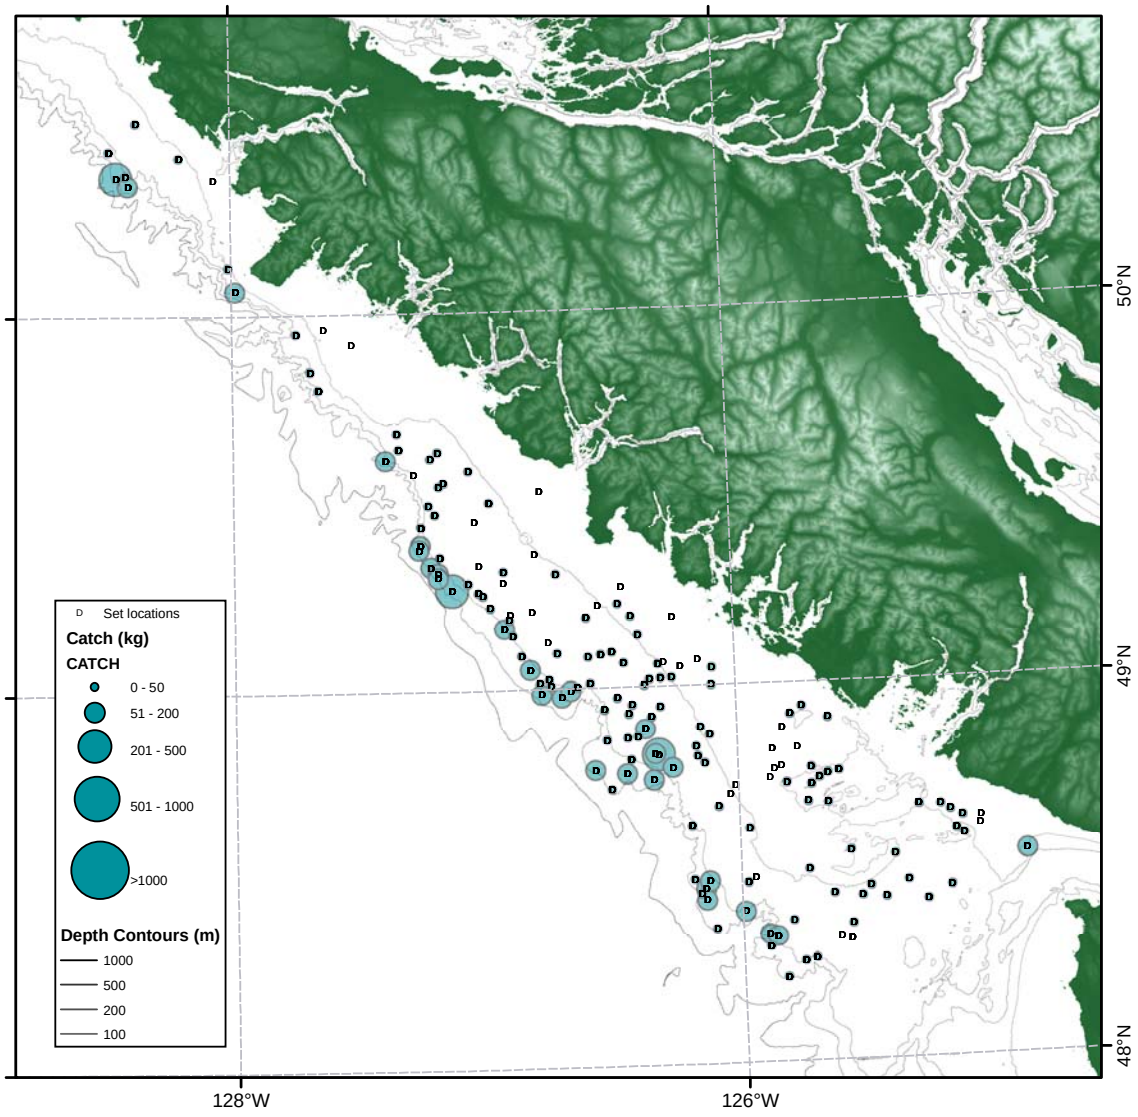

Figure 17: Distribution of Dover sole catches (kg), circles are scaled to catch size, sets with no catch are represented by the x symbol.

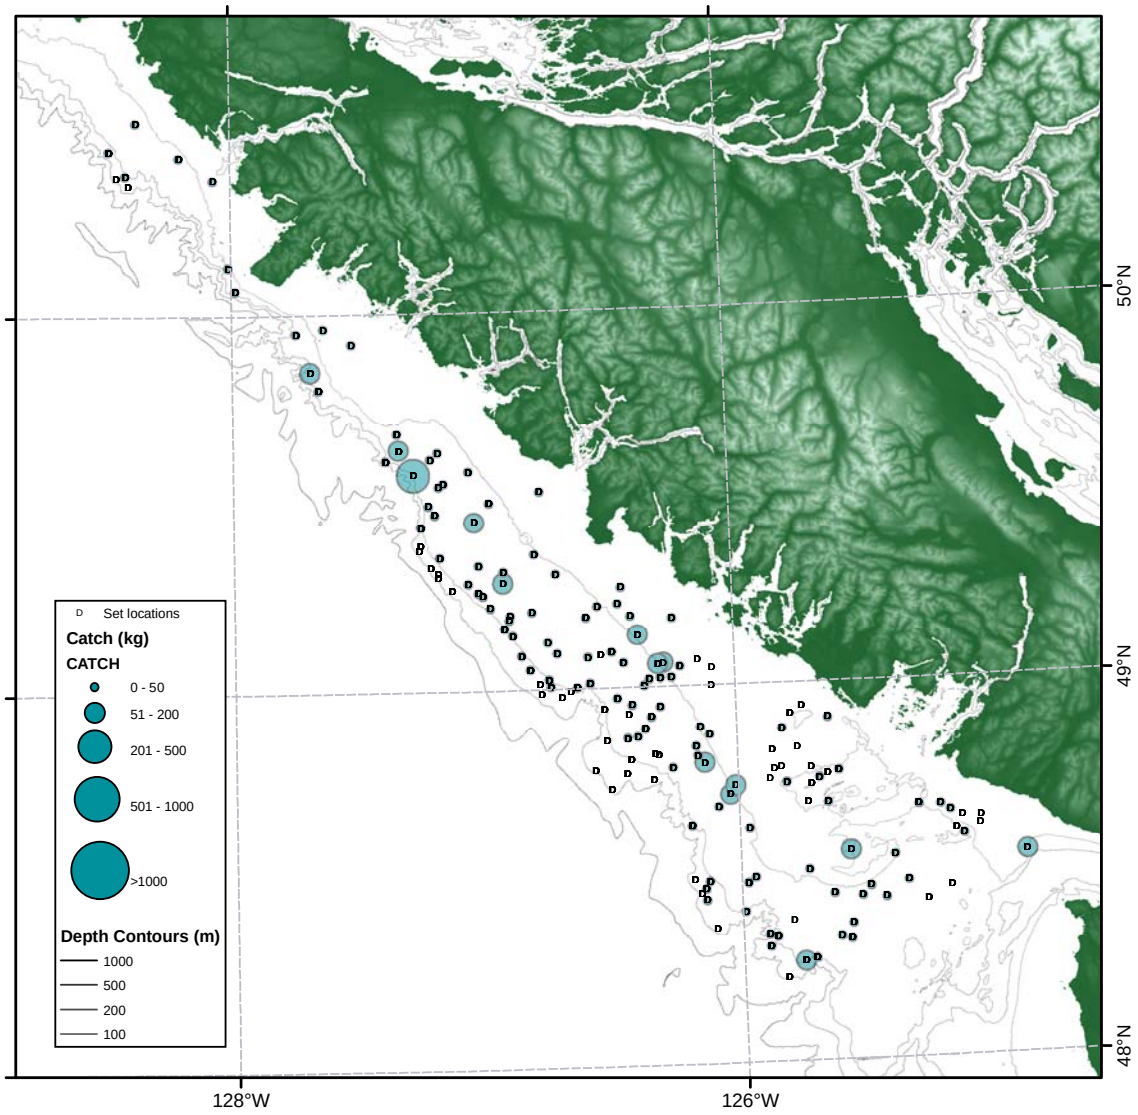

Figure 18: Distribution of lingcod catches (kg), circles are scaled to catch size, sets with no catch are represented by the x symbol.

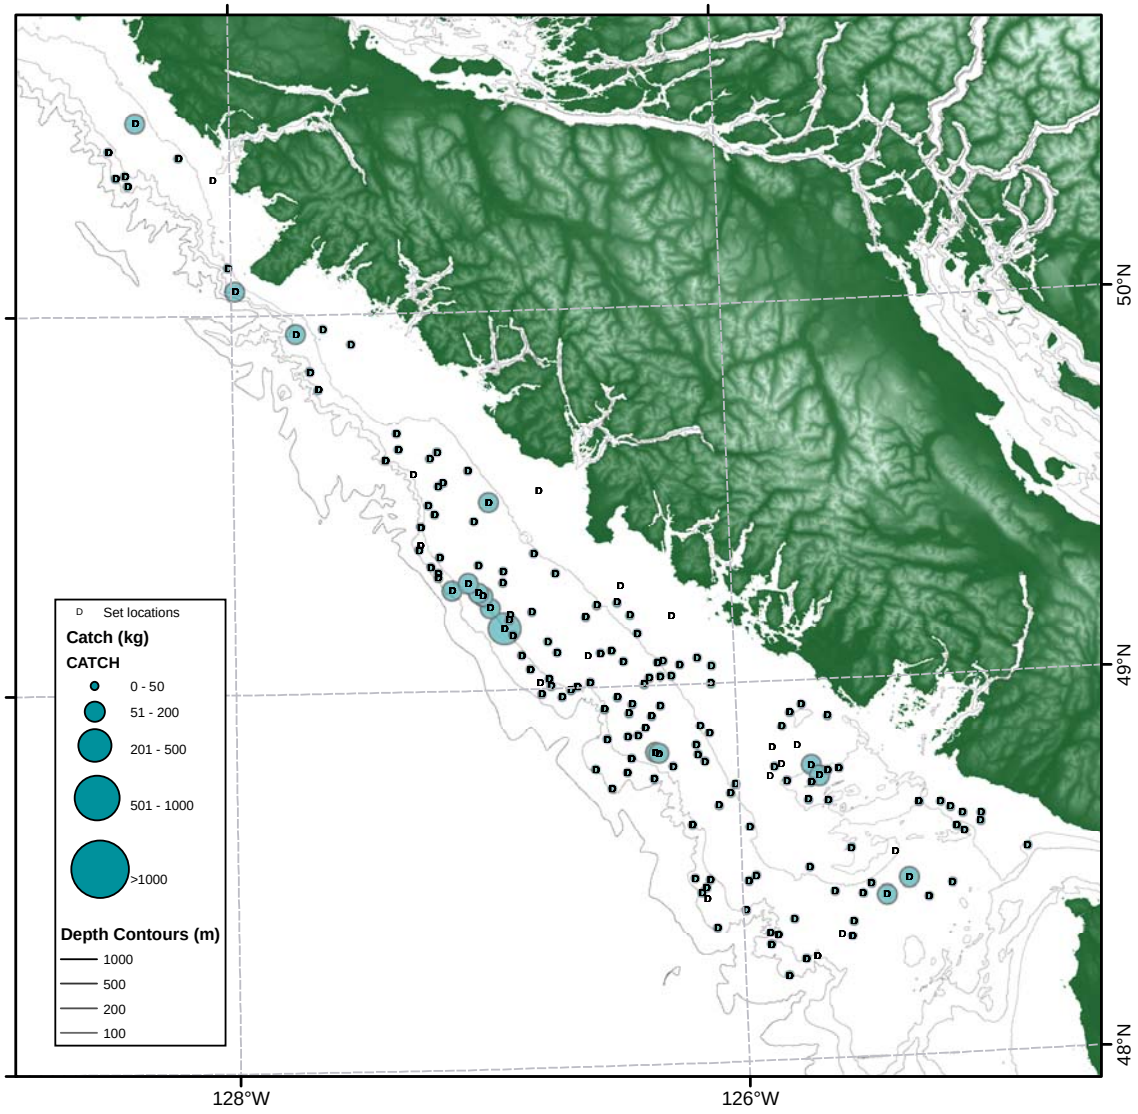

Figure 19: Distribution of rex sole catches (kg), circles are scaled to catch size, sets with no catch are represented by the x symbol.

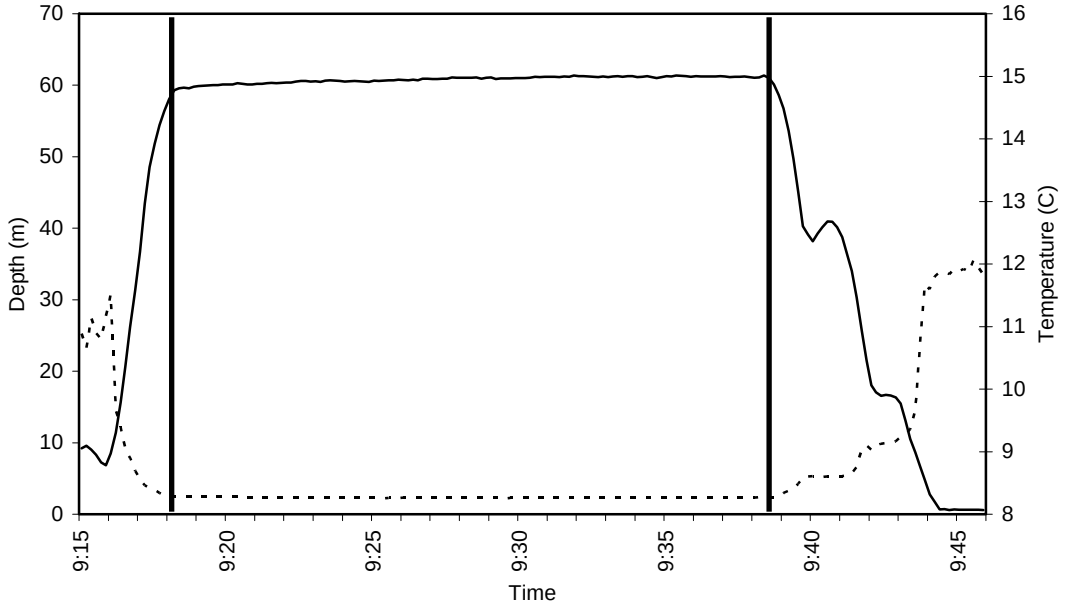

Figure 20: Example Seabird temperature and depth profile, the solid black line is depth and the dashed line is temperature, start and end bottom contact times are indicated by the vertical lines.

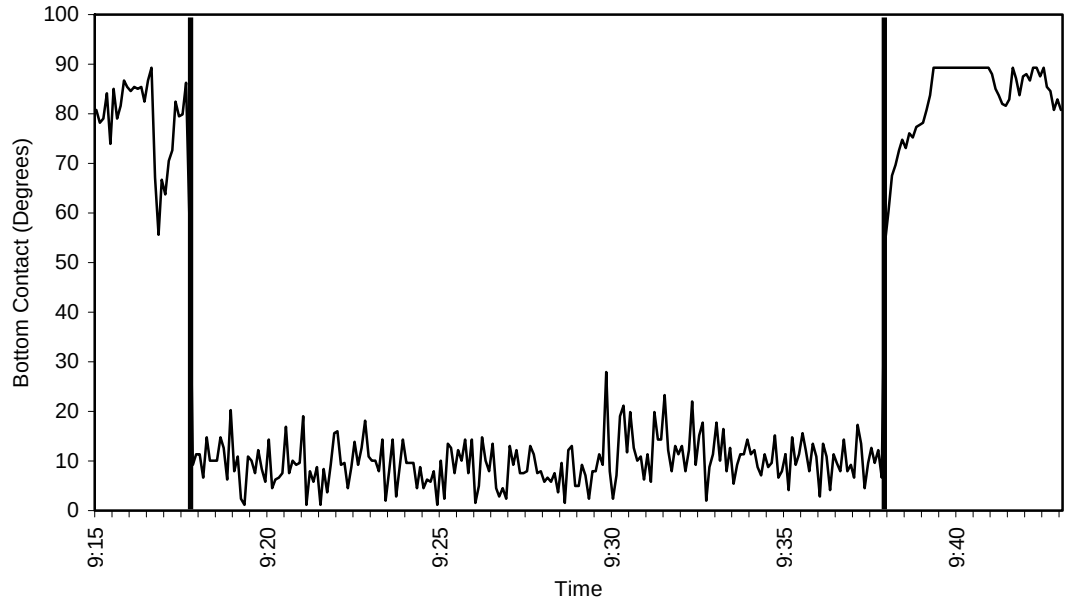

Figure 21: Bottom contact sensor trace for a tow on smooth mud or sand bottom. Start and end bottom contact times are indicated by the vertical lines.

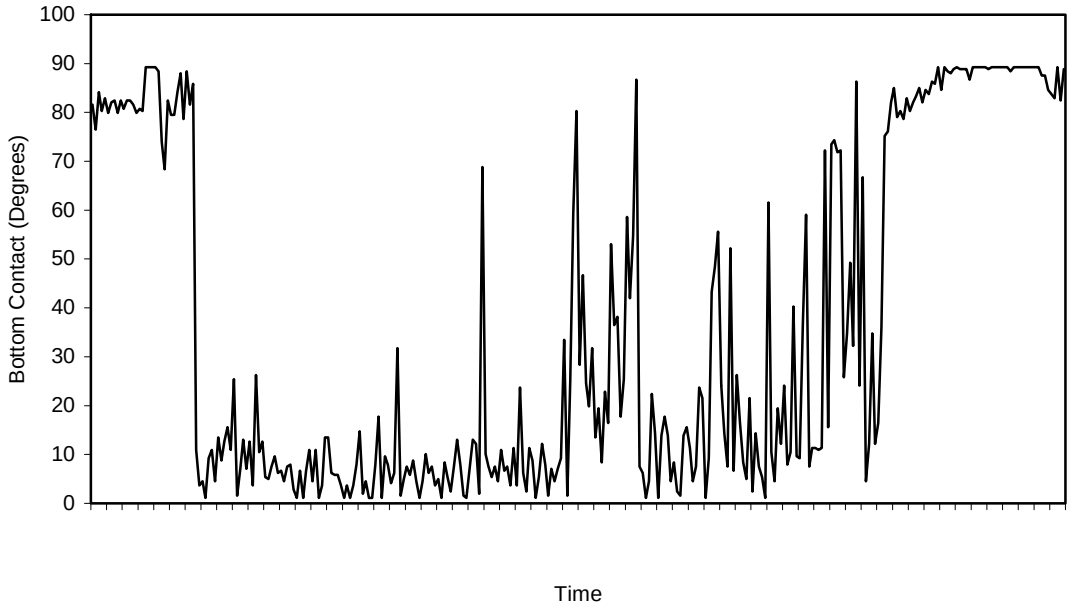

Figure 22: Bottom contact sensor trace for a set on rough bottom.

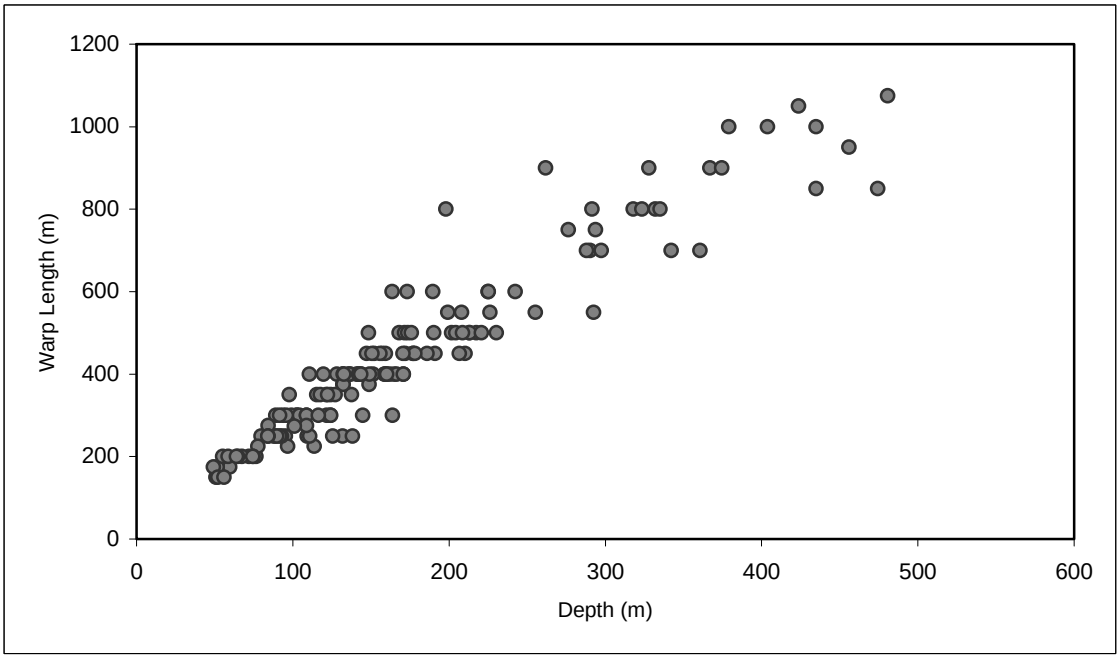

Figure 23: Plot of the length of main warp length deployed against the depth fished.

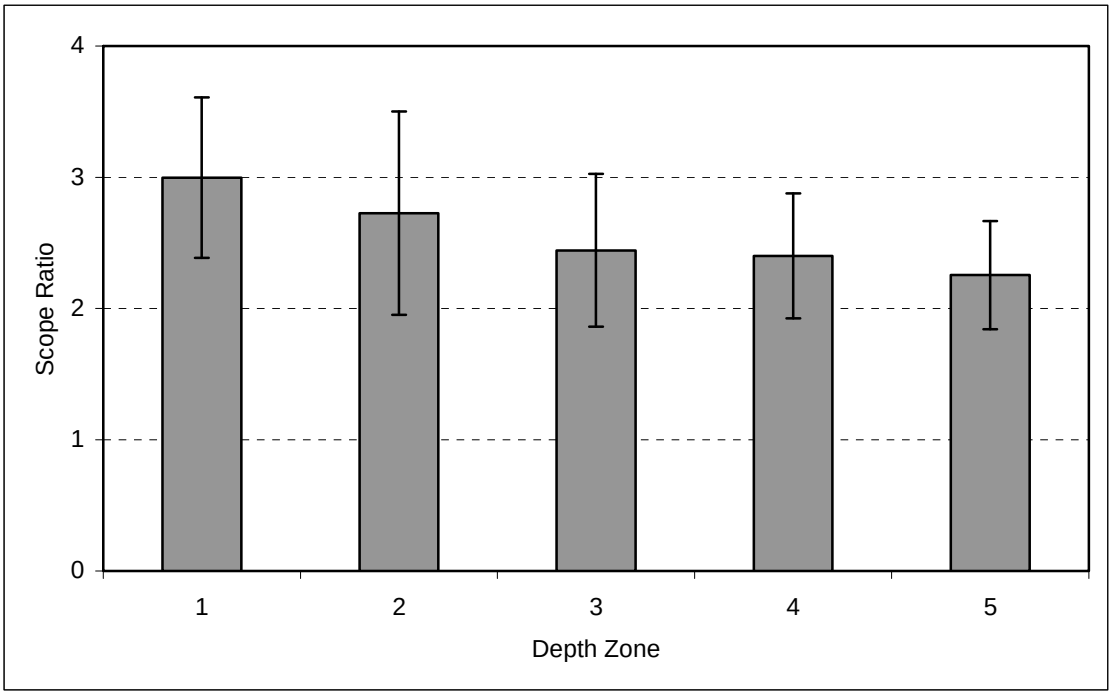

Figure 24: Mean scope ratio by depth zone, 1 = 0-100 m, 2= 101 – 200 m, 3 = 201 – 300 m, etc. Error bars are 1.96 standard deviations.

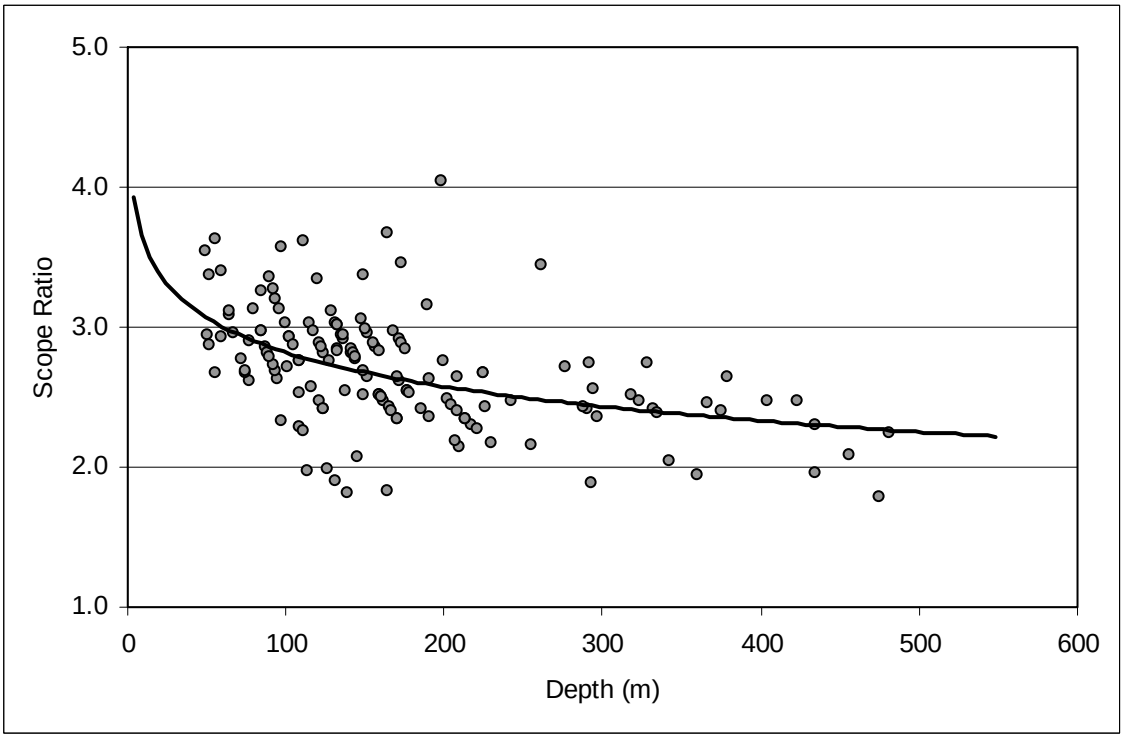

Figure 25: Plot of scope ratio and depth fished.

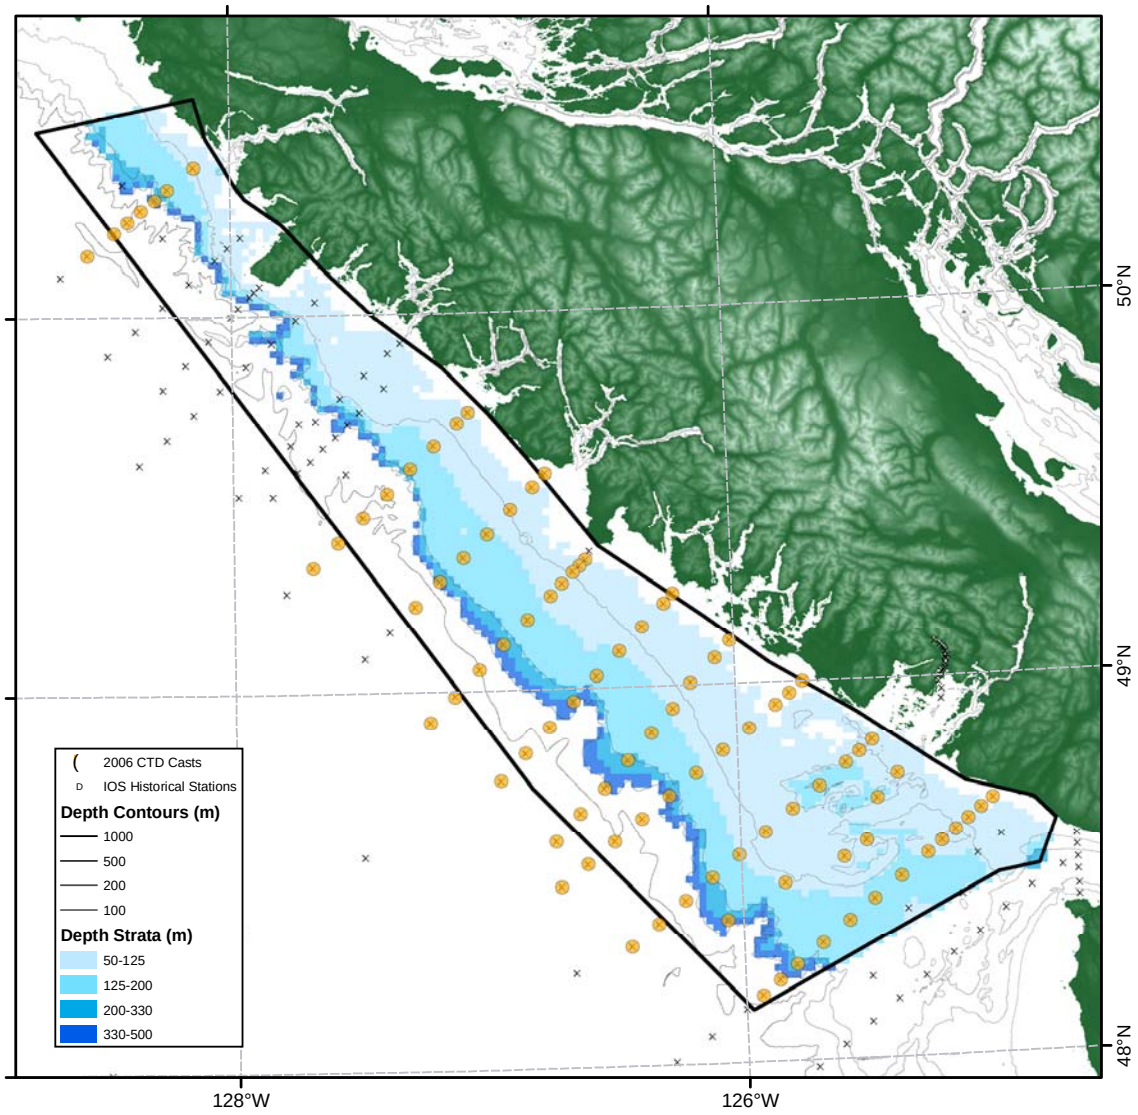

Figure 26: CTD stations occupied during the 2006 WCVI groundfish bottom trawl survey.

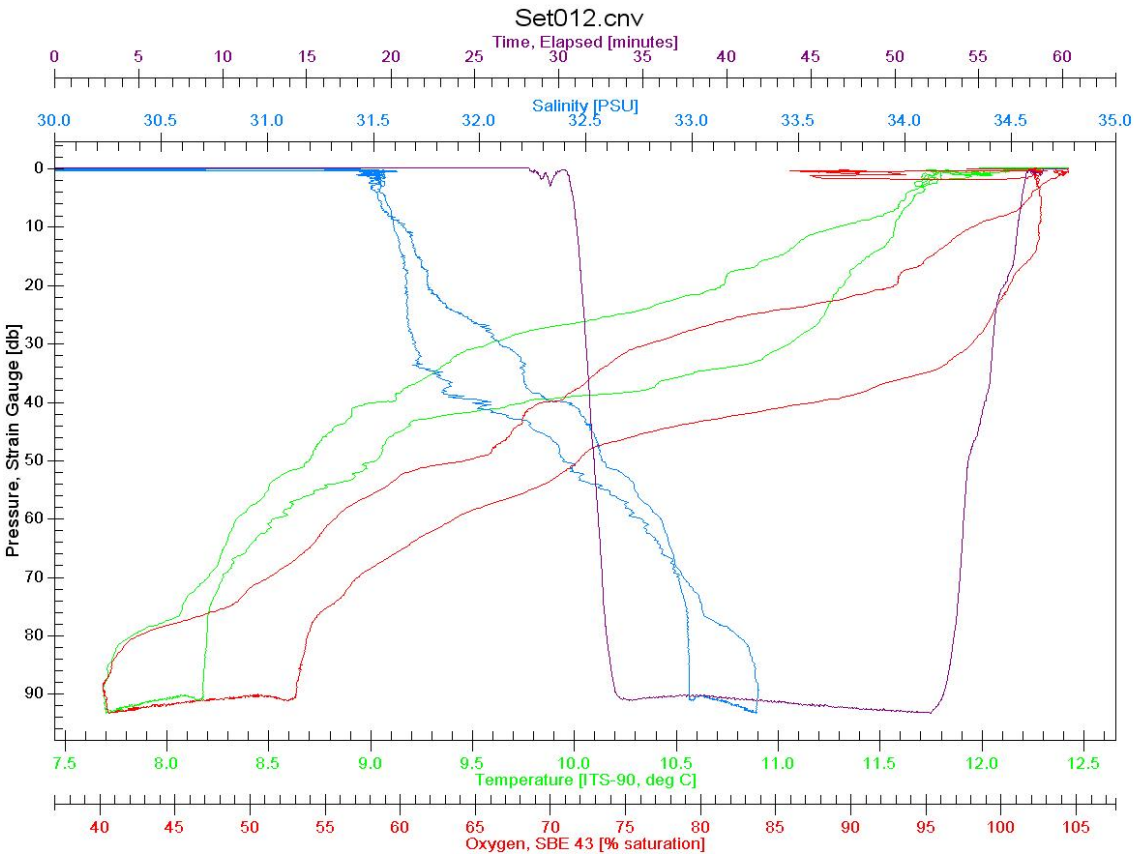

Figure 27: Example profile from the net mounted CTD showing depth, temperature, salinity, and dissolved oxygen levels during the deployment, while on the tow and during retrieval of tow 12.

Left Blank on Purpose

APPENDICES

Appendix 1: Criteria used to determine sole maturity stages.

Maturity stage	Code	Testes	Ovaries
Immature	**1**	Testes very small string–like and somewhat translucent or pinkish in colour.	Ovaries very small, translucent or pinkish in colour and somewhat gelatinous in texture.
Maturing	**2**	Testes enlarged, a distinct bulge evident but still translucent or pinkish in colour.	Ovaries relatively small, pinkish-yellow or cream in colour, granular in texture. No distinct eggs visible.
Developing	**3**	Testes enlarged, brown-white or white in colour, firm in texture.	Ovaries large, cream or yellow in colour, containing opaque eggs that can be distinguished by direct observation. Sex may be determined externally.
Running Ripe	**4**	Testes large, white and easily broken. No sperm evident.	Ovaries containing partly or wholly translucent eggs. Sex easily determined externally.
Spawning	**5**	Testes large, white and sperm evident.	Ovaries containing entirely translucent, mature ova. Eggs loose and will run from oviducts under slight pressure.
Spent	**6**	Testes flaccid, shrunken and yellow-brown in colour. Sperm ducts enlarged and a small amount of sperm may be present.	Ovaries large, flaccid and purple in colour; a few translucent eggs may be left. Ovarian membrane very bloodshot and sac-like.
Resting	**7**	Testes firm, small and yellow-brown in colour. Sperm ducts small.	Ovaries contracted and firm, pinkish-grey to cream-yellow in colour and may appear granular in texture but no distinct eggs are visible.

Appendix 2: Bridge Log details.

Appendix 4: Alphabetical listing of all species captured. Catch weight in kilograms, trace indicates that no single catch of that species was greater than 0.1 kg.

Common name	***Latin name***	**Occurrence**	**Catch (kg)**
American shad	*Alosa sapidissima*	18	14.42
Anemone	*Actiniaria*	22	18.97
Anomura	*Anomura*	1	Trace
Arminidae	*Arminidae*	1	Trace
Arrowtooth flounder	*Atheresthes stomias*	135	19640.74
Asteriidae	*Asteriidae*	1	Trace
Aurora rockfish	*Sebastes aurora*	4	4.4
Bank rockfish	*Sebastes rufus*	2	16.28
Basket stars	*Euryalina*	18	4.51
Benthopectinidae	*Benthopectinidae*	1	Trace
Big skate	*Raja binoculata*	12	243.05
Bigeye poacher	*Bathyagonus pentacanthus*	4	0.4
Bigfin eelpout	*Lycodes cortezianus*	17	24.99
Black eelpout	*Lycodes diapterus*	16	8.4
Black rockfish	*Sebastes melanops*	1	1.7
Blackbelly eelpout	*Lycodes pacificus*	44	7.48
Blackfin poacher	*Bathyagonus nigripinnis*	3	Trace
Blackfin sculpin	*Malacocottus kincaidi*	5	0.41
Blacktip poacher	*Xeneretmus latifrons*	7	Trace
Bocaccio	*Sebastes paucispinis*	28	648.03
Box crabs	*Lopholithodes*	1	0.54
Bristly crab	*Acantholithodes hispidus*	1	Trace
Brown box crab	*Lopholithodes foraminatus*	2	0.39
Brown cat shark	*Apristurus brunneus*	3	5.6
Butter sole	*Isopsetta isolepis*	1	0.18
Canary rockfish	*Sebastes pinniger*	49	8911.09
China rockfish	*Sebastes nebulosus*	2	10.87
Chinook salmon	*Oncorhynchus tshawytscha*	2	5.91
Chum salmon	*Oncorhynchus keta*	1	8.98
Coonstripe shrimp	*Pandalus danae*	1	Trace
Copper rockfish	*Sebastes caurinus*	1	5.04
Crangons	*Crangon*	4	Trace
Ctenophora	*Ctenophora*	1	Trace
Curlfin sole	*Pleuronichthys decurrens*	12	10.18
Cushion star	*Pteraster tesselatus*	4	1.55
Darkblotched rockfish	*Sebastes crameri*	38	522.49
Deepsea sole	*Embassichthys bathybius*	1	0.91
Dogwhelks	*Nassariidae*	2	0.02
Dover sole	*Microstomus pacificus*	137	4555.64
Dungeness crab	*Cancer magister*	1	0.68

Lanternfishes	*Myctophidae*	1	Trace
Leather star	*Dermasterias imbricata*	1	0.34
Lingcod	*Ophiodon elongatus*	119	2949.77
Long-armed sea star	*Orthasterias koehleri*	1	Trace
Longnose skate	*Raja rhina*	81	1076.78
Longspine thornyhead	*Sebastolobus altivelis*	2	6.28
Mediaster	*Mediaster*	1	Trace
Metridium	*Metridium*	7	10.76
Morning sun starfish	*Solaster dawsoni*	1	Trace
Night smelt	*Spirinchus starksi*	1	0.16
Northern anchovy	*Engraulis mordax mordax*	1	Trace
Northern lampfish	*Stenobrachius leucopsarus*	1	Trace
Northern ronquil	*Ronquilus jordani*	8	0.21
Octopus	*Octopoda*	2	0.24
Oikopleuridae	*Oikopleuridae*	1	Trace
Opalescent inshore squid	*Loligo opalescens*	4	0.21
Ophiuridae	*Ophiuridae*	5	Trace
Oregontriton	*Fusitriton oregonensis*	7	Trace
Pacific bobtail squid	*Rossia pacifica*	9	Trace
Pacific cod	*Gadus macrocephalus*	92	1876.46

Appendix 4: Continued

Common name	*Latin name*	Occurrence	Catch (kg)
Pacific hake	*Merluccius productus*	43	195.13
Pacific halibut	*Hippoglossus stenolepis*	92	1942.08
Pacific herring	*Clupea pallasi*	43	32.57
Pacific ocean perch	*Sebastes alutus*	62	8901
Pacific red octopus	*Octopus rubescens*	1	0.82
Pacific sand lance	*Ammodytes hexapterus*	4	1.25
Pacific sanddab	*Citharichthys sordidus*	59	1063.18
Pacific sardine	*Sardinops sagax*	5	0.72
Pacific tomcod	*Microgadus proximus*	2	Trace
Pacific viperfish	*Chauliodus macouni*	2	0.04
Pallid slipskin	*Lycodapus mandibularis*	1	Trace
Pallid urchin	*Strongylocentrotus pallidus*	7	1.83
Pandalid shrimp	*Pandalidae*	1	Trace
Peanutworms	*Sipuncula*	1	Trace
Petrale sole	*Eopsetta jordani*	97	425.99
Pile perch	*Rhacochilus vacca*	5	2.76
Pink scallop	*Chlamys rubida*	1	0.13
Pink shrimp (smooth)	*Pandalus jordani*	26	13.45
Pinpoint lampfish	*Nannobrachium regale*	8	0.05
Poachers	*Agonidae*	3	0.2
Prawn	*Pandalus platyceros*	29	8.42
Pterasteridae	*Pterasteridae*	1	Trace
Pygmy rockfish	*Sebastes wilsoni*	7	4.39
Quillback rockfish	*Sebastes maliger*	8	44.67
Quillfish	*Ptilichthys goodei*	1	Trace
Redbanded rockfish	*Sebastes babcocki*	50	356.57
Redstripe rockfish	*Sebastes proriger*	33	2394.82
Rex sole	*Glyptocephalus zachirus*	150	3323.95
Rockfishes	*Sebastinae*	2	2.2
Rose starfish	*Crossaster papposus*	3	Trace
Rosethorn rockfish	*Sebastes helvomaculatus*	38	133.67
Rougheye rockfish	*Sebastes aleutianus*	36	1288.86
Sablefish	*Anoplopoma fimbria*	82	4835.16
Salpidae	*Salpidae*	6	0.1
Sand star	*Luidia foliolata*	26	18.68
Sandpaper skate	*Bathyraja interrupta*	18	26.49
Scallop	*Pectinidae*	1	Trace
Schoolmaster gonate squid	*Berryteuthis magister*	10	16.91
Sea cucumber	*Holothuroidea*	24	6.24
Sea mouse	*Aphrodita*	3	Trace
Sea pens	*Pennatulacea*	1	Trace
Sea whip	*Osteocella septentrionalis*	5	0.81

Appendix 4: Continued

Common name	*Latin name*	Occurrence	Catch (kg)
Sharpchin rockfish	*Sebastes zacentrus*	47	3425.66
Shiner perch	*Cymatogaster aggregata*	11	0.49
Shining tubeshoulder	*Sagamichthys abei*	1	Trace
Shortbelly rockfish	*Sebastes jordani*	5	14.45
Shortraker rockfish	*Sebastes borealis*	14	219.89
Shortspine thornyhead	*Sebastolobus alascanus*	43	791.24
Sidestripe shrimp	*Pandalopsis dispar*	19	2.61
Silvergray rockfish	*Sebastes brevispinis*	42	1443.41
Slender sole	*Lyopsetta exilis*	94	143.13
Slim sculpin	*Radulinus asprellus*	2	Trace
Smelts	*Osmeridae*	1	0.05
Smootheye poacher	*Xeneretmus leiops*	3	0.04
Snailfishes	*Liparinae*	2	Trace
Snake prickleback	*Lumpenus sagitta*	1	Trace
Solasteridae	*Solasteridae*	3	3.59
Southern rock sole	*Lepidopsetta bilineata*	26	74.68
Spider crabs	*Majidae*	3	Trace
Spike shrimp (horned shrimp)	*Paracrangon echinata*	1	Trace
Spiny dogfish	*Squalus acanthias*	140	29468.54
Spiny red sea star	*Hippasteria spinosa*	9	4.33
Spiny scallop	*Chlamys hastata*	1	Trace
Splitnose rockfish	*Sebastes diploproa*	40	4604.2
Sponges	*Porifera*	6	8.21
Spotted ratfish	*Hydrolagus colliei*	133	2263.91
Squids	*Teuthoidea*	2	Trace
Starfish	*Asteroidea*	23	2.43
Stripetail rockfish	*Sebastes saxicola*	4	7.33
Sturgeon poacher	*Podothecus accipenserinus*	1	Trace
Sunflower starfish	*Pycnopodia helianthoides*	9	3.99
Surf smelt	*Hypomesus pretiosus*	1	Trace
Tanner crabs	*Chionoecetes*	4	19.82
Threadfin sculpin	*Icelinus filamentosus*	29	8.85
Tubeshoulders	*Platytroctidae*	1	Trace
Twoline eelpout	*Bothrocara brunneum*	1	0.53
Vermillion starfish	*Mediaster aequalis*	3	0.08
Walleye pollock	*Theragra chalcogramma*	17	32.93
White sea cucumber	*Eupentacta quinquesemita*	1	Trace
Whitebarred prickleback	*Poroclinus rothrocki*	9	Trace
Whitespotted sea cucumber	*Parastichopus leukothele*	14	9.87
Widow rockfish	*Sebastes entomelas*	12	54.93
Yelloweye rockfish	*Sebastes ruberrimus*	17	153.22
Yellowmouth rockfish	*Sebastes reedi*	9	475.04
Yellowtail rockfish	*Sebastes flavidus*	47	6041.09
