## **Canadian Manuscript Report of Fisheries and Aquatic Sciences**

Manuscript reports contain scientific and technical information that contributes to existing knowledge but which deals with national or regional problems. Distribution is restricted to institutions or individuals located in particular regions of Canada. However, no restriction is placed on subject matter, and the series reflects the broad interests and policies of Fisheries and Oceans Canada, namely, fisheries and aquatic sciences.

Manuscript reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in the data base *Aquatic Sciences and Fisheries Abstracts*.

Manuscript reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page.

Numbers 1-900 in this series were issued as Manuscript Reports (Biological Series) of the Biological Board of Canada, and subsequent to 1937 when the name of the Board was changed by Act of Parliament, as Manuscript Reports (Biological Series) of the Fisheries Research Board of Canada. Numbers 1426 - 1550 were issued as Department of Fisheries and Environment, Fisheries and Marine Service Manuscript Reports. The current series name was changed with report number 1551.

## **Rapport manuscrit canadien des sciences halieutiques et aquatiques**

Les rapports manuscrits contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais qui traitent de problèmes nationaux ou régionaux. La distribution en est limitée aux organismes et aux personnes de régions particulières du Canada. Il n'y a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques de Pêches et Océans Canada, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports manuscrits peuvent être cités comme des publications à part entière. Le titre exact figure au-dessus du résumé de chaque rapport. Les rapports manuscrits sont résumés dans la base de données *Résumés des sciences aquatiques et halieutiques*.

Les rapports manuscrits sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre.

Les numéros 1 à 900 de cette série ont été publiés à titre de Manuscrits (série biologique) de l'Office de biologie du Canada, et après le changement de la désignation de cet organisme par décret du Parlement, en 1937, ont été classés comme Manuscrits (série biologique) de l'Office des recherches sur les pêcheries du Canada. Les numéros 901 à 1425 ont été publiés à titre de Rapports manuscrits de l'Office des recherches sur les pêcheries du Canada. Les numéros 1426 à 1550 sont parus à titre de Rapports manuscrits du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 1551.

## ABSTRACT

Olsen, N., Rutherford, K.L., Stanley, R.D., and Wyeth, M.R. 2009. Hecate Strait groundfish bottom trawl survey, May 26<sup>th</sup> to June 21<sup>st</sup>, 2009. Can. Manuscr. Rep. Fish. Aquat. Sci. 2901: vi + 49 p.

A bottom trawl survey of Hecate Strait was conducted on the Canadian Coastguard Ship W. E. Ricker between May 26<sup>th</sup> and June 21<sup>st</sup>, 2009. This was the third survey in what is intended to be a long-term survey series, coordinated with other area-specific surveys that together cover the continental shelf and upper slope of most of the British Columbia coast. The objective of these surveys is to provide fishery-independent abundance indices of all demersal fish species available to bottom trawling, as well as to collect biological samples of selected species.

The survey conducted 156 successful tows from a total of 163. The mean catch per successful tow was 370 kg, averaging about 21 different species of fish and invertebrates in each. The most abundant fish species encountered was arrowtooth flounder (*Atheresthes stomias*) followed by spotted ratfish (*Hydrolagus colliei*), sablefish (*Anoplopoma fimbria*), rex sole (*Glyptocephalus zachirus*), and English sole (*Parophrys vetulus*). Biological data, including individual length, weight, sex, maturity, and age structure were collected from 64 different species of fish. Oceanographic data and net geometry were also recorded for most tows, including water temperature, depth, headrope height, and doorspread.

## RÉSUMÉ

Olsen, N., Rutherford, K.L., Stanley, R.D., and Wyeth, M.R. 2009. Hecate Strait groundfish bottom trawl survey, May 26<sup>th</sup> to June 21<sup>st</sup>, 2009. Can. Manuscr. Rep. Fish. Aquat. Sci. 2901: vi + 49 p.

Un relevé au chalut de fond a été réalisé, du 26 mai au 21 juin 2009, dans le détroit d'Hécate par le navire W.E. Ricker de la Garde côtière canadienne. Il s'agit du troisième relevé d'une série d'échantillonnages qui se veulent à long terme et qui sont coordonnés avec d'autres échantillonnages par secteur couvrant, ensemble, la plate-forme continentale et la partie supérieure du talus de la majeure partie de la côte de la Colombie-Britannique. L'objectif de ces échantillonnages est d'établir des indices d'abondance, indépendants de la pêche, de toutes les espèces de poissons démersaux capturables au chalut de fond et de recueillir des données biologiques sur les espèces sélectionnées.

Des 163 traits de chalut réalisés, 156 ont été fructueux. La prise moyenne par trait pesait 370 kg. Quelques 21 espèces différentes de poissons et d'invertébrés ont été prises en moyenne à chaque trait. La plie à grande bouche (*Atheresthes stomias*) a été l'espèce la plus abondante; venaient ensuite la chimère d'Amérique (*Hydrolagus colliei*), la morue charbonnière (*Anoplopoma fimbria*), la sole américaine (*Glyptocephalus zachirus*) et la sole anglaise (*Parophrys vetulus*). Des données biologiques (longueur, poids, sexe, stade de maturité et structure d'âge) ont été recueillies pour 64 espèces différentes de poisson. Des données océanographiques et des données sur la géométrie du chalut (température de l'eau, profondeur, hauteur de la ralingue supérieure et écartement des panneaux) ont également été recueillies pour la plupart des traits.

## **INTRODUCTION**

In 2003 a report by the Pacific Scientific Advice Review Committee (PSARC) recommended development of fishery-independent relative abundance indices using bottom trawl surveys in British Columbia waters (Sinclair et al., 2003). As an initial step, it recommended that a pilot survey be conducted in PMFC major areas 5A and 5B (Queen Charlotte Sound). This region was recommended in part because it is not covered by other bottom trawl surveys and it represents a significant portion of the commercial bottom trawl fishery.

The first Queen Charlotte Sound survey was successfully completed in the summer of 2003 (Olsen et al., 2007). Following that, additional surveys were planned for the west coast of Vancouver Island beginning in 2004, Hecate Strait beginning in 2005, and the west coast of the Queen Charlotte Islands beginning in 2006. These surveys are to be conducted on a rotating biennial schedule with the Queen Charlotte Sound and Hecate Strait surveys conducted in odd-numbered years and the west coast Vancouver Island and west coast Queen Charlotte Islands surveys conducted in even-numbered years. Together they provide comprehensive coverage of the continental shelf and upper slope of the British Columbia Coast (Figure 1).

This document provides a brief synopsis of the 2009 Hecate Strait groundfish bottom trawl survey, including the methods used and data collected. It is not intended as a comprehensive review of the survey, nor does it provide interpretive analysis of the survey results. Reports of the previous two Hecate Strait surveys are given in Workman et al., 2008 and Olsen et al., 2009.

## **METHODS**

### **VESSEL AND FISHING GEAR**

The survey was conducted aboard the Canadian Coast Guard Ship CCGS W. E. Ricker (Figure 2). The trawl net used was an Atlantic Western IIA box trawl (Table 1; Figure 3) connected to 1,100 kg U.S.A. Jet doors.

### **STAFF SUMMARY**

A total of 14 personnel were involved in the survey, which was split into 2 legs of 14 and 15 days each, respectively, with 7 staff in each (Table 2).

### **SURVEY DESIGN**

The study area consists of Hecate Strait, from approximately latitude 52° 40' N to latitude 54° 40' N and westward into Dixon Entrance to approximately longitude 133° 00' W, covering depths from 10 to 500 meters (Figure 4), and categorized into four distinct strata (Table 3; Figure 4). The southern region of this survey is nearly contiguous with the most northerly extent of the Queen Charlotte Sound survey.

We divided the survey area into a contiguous grid of 4 km<sup>2</sup> blocks and from these blocks we randomly selected 121 fishing locations. The number of locations and the allocation of locations across strata were based on an analysis by Sinclair et al. (2003) and were intended to minimize observational error for the most important commercial groundfish species (Figure 5).

### **OPERATIONS**

#### **Fishing**

Fishing commenced at approximately 7 AM and ended at approximately 7 PM each day, to coincide with the ship's 12 hour crew rotation schedule.

Prior to fishing, the fishing master and chief scientist reviewed the selected fishing locations to determine a candidate set of locations to visit throughout the day. During this review process the fishing master would sometimes determine, based on his experience and knowledge of an area, that one or more locations were not fishable. In such cases we would mark the locations as "rejected based on prior knowledge".

We frequently began fishing immediately on arrival at a fishing location. However, if the fishing master was not familiar with an area we would "sound" the region (traverse the location and examine the depth sounder trace) to determine if it was suitable for trawling. If it was not, we marked the location and "rejected based on inspection".

When trawling, the fishing master would attempt to tow through the center of the 4 km<sup>2</sup> fishing block, usually following a depth contour. However, where the bottom topography made this difficult or impossible, the fishing master would trawl wherever he felt he could obtain a successful result, with the stipulation that at least half of the total

trawl track had to be within the 4 km<sup>2</sup> block (Figure 6). The scope used in 2009 is shown in Table 4 and Figure 7.

To determine the start of each 20 minute tow, we monitored the real-time net sensor data to establish when the net reached the sea floor, at which point we considered the net to be actively fishing. Nineteen minutes after the start of the tow, we retrieved the net. Retrieval was done one minute early because slack in the warps creates a lag of about one minute before the net leaves the bottom. Although our target on-bottom time was 20 minutes, we accepted tows that were at least 15 minutes in length. This was a pragmatic decision that allowed us to retain many tows that would otherwise have been failures due to hang-ups or early haul-backs.

The result of trawling was either a successful tow, or a hang-up or tear-up of the trawl net. In the event of a hang-up or tear-up, we would either mark the location as “rejected after one or more attempts to fish” or make additional attempts to fish. Thus, we kept records of the three scenarios that resulted in a location being removed from the sampling frame:

- Rejection based on prior knowledge
- Rejection based on on-ground inspection
- Rejection based on one or more failed fishing attempts

Rejected locations were removed from the sampling frame for the current and all future surveys. Thus, every year of the survey results in the removal of some unfishable area, which over time, will lead to increasing efficiency (i.e. we will spend less time surveying areas that cannot be fished).

### **Gear and Oceanographic Sensors**

The trawl net was equipped with a Simrad ITI Trawl System that provided real-time net depth, doorspread and wingspread values. These data allowed us to continually monitor the net during fishing. In addition to these real-time sensors, we also attached data-logging probes to collect water temperature and pressure/depth (Seabird SBE 39), dissolved oxygen, pH, salinity, temperature, and depth (Seabird SBE 19plus), and contact of the trawl net with the sea floor (NMFS Bottom Contact Sensor). Data from these logging probes were downloaded at the end of each day.

### **Catch Processing**

At the end of each tow, the net was retrieved and the catch dumped into a hopper in the fish processing lab. Catch was sorted by species into separate baskets as it moved along a conveyor system. Baskets were weighed to the nearest 0.1 kg using a large capacity, motion-compensating electronic balance (Marel Model M1100/M2000, 60 kg capacity). For small catches the number of individuals was often recorded as well as the weight. Catch was sorted to the lowest taxonomic group possible. For most fishes this was to the level of species; invertebrates, however, were often only keyed to phylum or order.

## **Biological Sampling**

While the primary purpose of this survey was to generate fishery independent indices of relative abundance, our second goal was to collect associated biological information on the size, sex, and age composition of selected species. In particular, our biological sampling priorities were to collect length and sex frequencies on all species in the catch of each tow (subject to a minimum number of specimens criteria), to collect representative samples of specimen length and weight, and to collect age samples for select species.

We selected age samples from the dominant (by weight) catch in each tow, as well as certain species deemed high priority due to concerns over stock status (for example, Bocaccio, lingcod, and Pacific cod). Otoliths (calcareous accretions of the inner ear) were collected from rockfish and flatfish species while fin clips were taken from lingcod and Pacific cod. Both of these structures grow in a series of annular rings that can be counted to determine age.

## **RESULTS**

### **FISHING**

We divided the survey into 2 legs of 14 and 15 days each. The overall pattern of vessel movement during each leg is shown in Figure 8.

From a total of 27 survey days, 5 days were required for travel at the start and end of the survey, 1 day was required for crew changes, and almost a whole day (May 29<sup>th</sup>) was required to transport a staff member to a medical facility. Thus, we ended with a total of about 20 full fishing days, in which time we conducted 163 tows, of which 156 were successful and 7 were unsuccessful due to hang-ups or tear-ups, for an average of about 7 successful tows per fishing day (Table 5).

The final status of the 2009 sampling frame includes 156 successfully fished locations, 17 locations rejected prior to fishing, based on the fishing master's knowledge, 41 locations rejected based on on-ground inspection, and 6 locations rejected after one or more failed fishing attempts (Figure 9). One location was left un-inspected and un-fished due to time constraints at the end of the survey.

### **CATCH**

Catch weight per tow was typically less than 1,500 kg and on average, we observed about 10 to 30 species per tow (Figure 10 and Figure 11). We caught a total of 57,920 kg of fish and invertebrates. Most of this (57,098 kg) consisted of 109 different taxonomic groups of fish, including 28 rockfish taxa and 17 flatfish taxa. The remainder (822 kg) consisted of 130 invertebrate groups (Table 6). Of the fish species, arrowtooth flounder (*Atheresthes stomias*) was the dominant by weight, followed by spotted ratfish (*Hydrolagus colliei*), sablefish (*Anoplopoma fimbria*), rex sole (*Glyptocephalus zachirus*), and English sole (*Parophrys vetulus*) (Table 7). Biomass indices over the history of the survey (2005, 2007, and 2009) are shown for selected species in Figure 12.

## **SAMPLES AND SPECIMENS**

We sampled 64 species of fish for attributes such as length, weight, sex, maturity, and age (Table 8, Table 9, and Table 10).

## **GEAR AND OCEANOGRAPHIC SENSORS**

We collected Seabird 39 data (water temperature and depth) from 158 tows and Seabird 19plus data (water temperature, depth, pH, salinity, and dissolved oxygen from 158 tows (Table 11, Figure 13). Although we have not yet analyzed these data in detail, they may prove useful for explaining, or at least correlate to, short term anomalies in abundance trends. In addition, they provide a base reference for detecting future climate change.

We collected bottom contact data from the NMFS Bottom Contact Sensor from 160 tows (Table 11). These data provide a record of the trawl net contact with the sea floor and thus are useful not only for determining the quality and quantity of the sea floor contact, but also indicate the relative rugosity of the sea floor. We use these data to determine the exact times that the trawl net first and last contacts the sea floor, thus providing an accurate measure of total bottom contact time (Figure 14).
