Canadian Technical Report of Hydrography and Ocean Sciences

Technical reports contain scientific and technical information of a type that represents a contribution to existing knowledge but which is not normally found in the primary literature. The subject matter is generally related to programs and interests of the Oceans and Science sectors of Fisheries and Oceans Canada.

Technical reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in the data base *Aquatic Sciences and Fisheries Abstracts*.

Technical reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications and the last number issued under each title are published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 38: Index to Publications 1981. The current series began with Report Number 1 in January 1982.

Rapport technique canadien sur l'hydrographie et les sciences océaniques

Les rapports techniques contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles mais que l'on ne trouve pas normalement dans les revues scientifiques. Le sujet est généralement rattaché aux programmes et intérêts des secteurs des Océans et des Sciences de Pêches et Océans Canada.

Les rapports techniques peuvent être cités comme des publications à part entière. Le titre exact figure au-dessus du résumé de chaque rapport. Les rapports techniques sont résumés dans la base de données *Résumés des sciences aquatiques et halieutiques*.

Les rapports techniques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page de titre.

Les établissements de l'ancien secteur des Sciences et Levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports en décembre 1981. Vous trouverez dans l'index des publications du volume 38 du *Journal canadien des sciences halieutiques et aquatiques*, la liste de ces publications ainsi que le dernier numéro paru dans chaque catégorie. La nouvelle série a commencé avec la publication du rapport numéro 1 en janvier 1982.

ACKNOWLEDGMENTS

The publication of the report is supported by Program of Energy Research and Development (PERD). The materials contained in the report are results of research carried out under several PERD projects. The work leading to this publication is a joint effort of many scientists, oceanographers and program managers. We would like to thank particularly Tom Yao, Ewa Dunlap, Brendan DeTracey, Peter Smith, Charles Hannah for their contributions. We also thank Brian Petrie and Adam Drozdowski for their helpful reviews of the report.

LIST OF FIGURES

Velocity Field for The Model Domain

Bottom topography showing 50 (red), 100 (cyan), 200 (blue), 500 (green) and 1000 m (black) isobaths	7
Velocity field at 0 m for winter, spring, summer and autumn	8
Velocity field at 50 m for winter, spring, summer and autumn	12
Velocity field at 100 m for winter, spring, summer and autumn	16
Velocity field at 200 m for winter, spring, summer and autumn	20
Velocity field at 500 m for winter, spring, summer and autumn	24
Velocity field at 1000 m for winter, spring, summer and autumn	28
Velocity field at 10 m from the bottom for winter, spring, summer and autumn	32

Velocity field for Baffin Bay

Bottom topography showing 50 (red), 100 (cyan), 200 (blue), 500 (green) and 1000 m (black) isobaths	36
Velocity field at 0 m for winter, spring, summer and autumn	37
Velocity field at 50 m for winter, spring, summer and autumn	38
Velocity field at 100 m for winter, spring, summer and autumn	39
Velocity field at 200 m for winter, spring, summer and autumn	40
Velocity field at 500 m for winter, spring, summer and autumn	41
Velocity field at 1000 m for winter, spring, summer and autumn	42
Velocity field at 10 m from the bottom for winter, spring, summer and autumn	43

Velocity field for the northern Labrador Sea

Bottom topography showing 50 (red), 100 (cyan), 200 (blue), 500 (green) and 1000 m (black) isobaths	44
Velocity field at 0 m for winter, spring, summer and autumn	45
Velocity field at 50 m for winter, spring, summer and autumn	47
Velocity field at 100 m for winter, spring, summer and autumn	49
Velocity field at 200 m for winter, spring, summer and autumn	51
Velocity field at 500 m for winter, spring, summer and autumn	53
Velocity field at 1000 m for winter, spring, summer and autumn	55
Velocity field at 10 m from the bottom for winter, spring, summer and autumn	57

Velocity field for the N.E. Newfound Shelf and the Grand Banks

Bottom topography showing 50 (red), 100 (cyan), 200 (blue), 500 (green) and 1000 m (black) isobaths	59
Velocity field at 0 m for winter, spring, summer and autumn	60
Velocity field at 50 m for winter, spring, summer and autumn	62
Velocity field at 100 m for winter, spring, summer and autumn	64

Velocity field at 200 m for winter, spring, summer and autumn	66
Velocity field at 500 m for winter, spring, summer and autumn	68
Velocity field at 1000 m for winter, spring, summer and autumn	70
Velocity field at 10 m from the bottom for winter, spring, summer and autumn	72

Velocity field for the Gulf of St. Lawrence and the Scotian Shelf

Bottom topography showing 50 (red), 100 (cyan), 200 (blue), 500 (green) and 1000 m (black) isobaths	74
Velocity field at 0 m for winter, spring, summer and autumn	75
Velocity field at 50 m for winter, spring, summer and autumn	77
Velocity field at 100 m for winter, spring, summer and autumn	79
Velocity field at 200 m for winter, spring, summer and autumn	81
Velocity field at 10 m from the bottom for winter, spring, summer and autumn	83

Normal velocity sections

Normal velocity for the Davis Strait section for winter, spring, summer and autumn	85
Normal velocity for the Labrador Sea section (western shelf) for winter, spring, summer and autumn	86
Normal velocity for the Labrador Sea section for winter, spring, summer and autumn	87
Normal velocity for the Bonavista section for winter, spring, summer and autumn	88
Normal velocity for the Flemish Cape section for winter, spring, summer and autumn	89
Normal velocity for the Southeast Grand Banks section for winter, spring, summer and autumn	90
Normal velocity for the Louisbourg section for winter, spring, summer and autumn	91
Normal velocity for the Halifax section for winter, spring, summer and autumn	92
Normal velocity for the Cabot Strait Section for winter, spring, summer and autumn	93
Normal velocity for the northwest Gulf of St. Lawrence for winter, spring, summer and autumn	94

ABSTRACT

Seasonal ocean currents from Canadian East Coast Ocean Model are presented in graphical forms: horizontal maps of current fields at different depths and vertical sections of normal component of currents. The horizontal maps are displayed separately for the entire model domain, Baffin Bay, northern Labrador Sea, the N.E. Newfoundland Shelf and the Grand Banks, the Gulf of St. Lawrence and the Scotian Shelf. The vertical sections include Davis Strait, mid-Labrador Sea Section, Bonavista Section, Flemish Cap Section, southeast Grand Banks Section, Cabot Strait, northwest Gulf of St. Lawrence Section, Louisbourg Section and Halifax Section.

RESUME

Les courants océaniques saisonniers du modèle couplé glace-océan de la côte Est du Canada sont représentés graphiquement sous forme de cartes horizontales des champs de courant à différentes profondeurs et de coupes transversales des composantes normales des courants. Les cartes horizontales sont affichées séparément pour tout le domaine visé par le modèle : la baie de Baffin, le nord de la mer du Labrador, le nord-est du plateau continental et les Grands Bancs de Terre-Neuve, le golfe du Saint-Laurent et le plateau néo-écossais. Les coupes transversales portent sur le détroit de Davis, le centre de la mer du Labrador, Bonavista, le Bonnet flamand, le sud-est des Grands Bancs, le détroit de Cabot, le nord-ouest du golfe du Saint-Laurent, Louisbourg et Halifax.

1.0 INTRODUCTION

Quantitative information about ocean currents can be obtained by a variety of measuring instruments and analysis techniques including mechanical current meter, drifter, acoustic Doppler current profiler, electromagnetic current meter, high frequency radar, coherence analysis of satellite data and dynamical calculations based on temperature and salinity data. Direct measurement using moored instruments or drifters is generally considered to give the most accurate speeds and directions of ocean currents. However, the spatial and temporal coverage of direct measurements is usually very limited and must be used in conjunction with other methods to construct circulation patterns or velocity fields. In recent years, model simulated ocean currents calibrated by data from direct measurements have been increasingly used for ocean research. They fill the gaps in in-situ measurements and provide a more complete picture of the circulation.

In this report, ocean currents computed from Canadian East Coast Ocean Model (CECOM) are presented in graphical forms. The model currents, which cover 11 years, have been validated using current meter and drifter data collected by various organizations.

2.0 MODEL SETUP AND SIMULATION

CECOM is a coupled ice-ocean model. The ocean component of the model is the latest version of Princeton Ocean Model (Blumberg and Mellor, 1987). The ice component is a multi-category sea ice model in which the internal ice stress is derived from the viscous plastic rheology of Hibler (1980) and ice thickness is characterized by a thickness distribution function from which ice concentration and mean ice thickness can be calculated. A full description of the model can be found in Yao et al. (2000) and Tang et al. (2008).

The model domain extends from the northern Baffin Bay to the northern wall of the Gulf Stream, and from the St. Lawrence Estuary to 42°W (Fig. 1). The horizontal resolution is 0.1°×0.1°. The grid is defined in a rotated spherical coordinate system. Monthly climatological ocean temperature and salinity are used as the initial state and as open ocean boundary conditions. The monthly climatologies were obtained from an objective analysis of historical temperature and salinity data archived at BIO (Tang, 2007).

The model is driven by wind stress, heat and moisture fluxes calculated from atmospheric parameters of North American Regional Reanalysis (NARR, Mesinger et al., 2006). The atmospheric variables include surface winds, air temperature, cloud cover, dew point temperature, air pressure and precipitation.

In order to obtain a best representation of the current field from the model, the time periods of the model simulation were selected to match the time periods of available current meter data (Fig. 2), which were used to calibrate and validate the model. In these periods, the data cover an extensive area within the model domain. The total time of the model run is 11 years, which consists of four separate periods, 1987-1989; 1994-1996; 2002-2004 and 2007-2008. In the model runs, daily sea surface temperatures derived from satellite images (Reynolds et al., 2010) were assimilated using the method of Wu et al. (2010). In addition, a 3-D nudging of the temperature and salinity was employed with a constant time scale of 90 days to reduce long-term drift in deep waters.

In the following section, the seasonally mean current fields from the 11-year model run are presented. There are two types of plots: horizontal velocity field at given depths and 10 m from the ocean bottom, and normal velocity in vertical sections. In the horizontal velocity plots, velocities less than 0.02 m s⁻¹ are not drawn. The locations of the vertical sections are shown in Fig. 3.

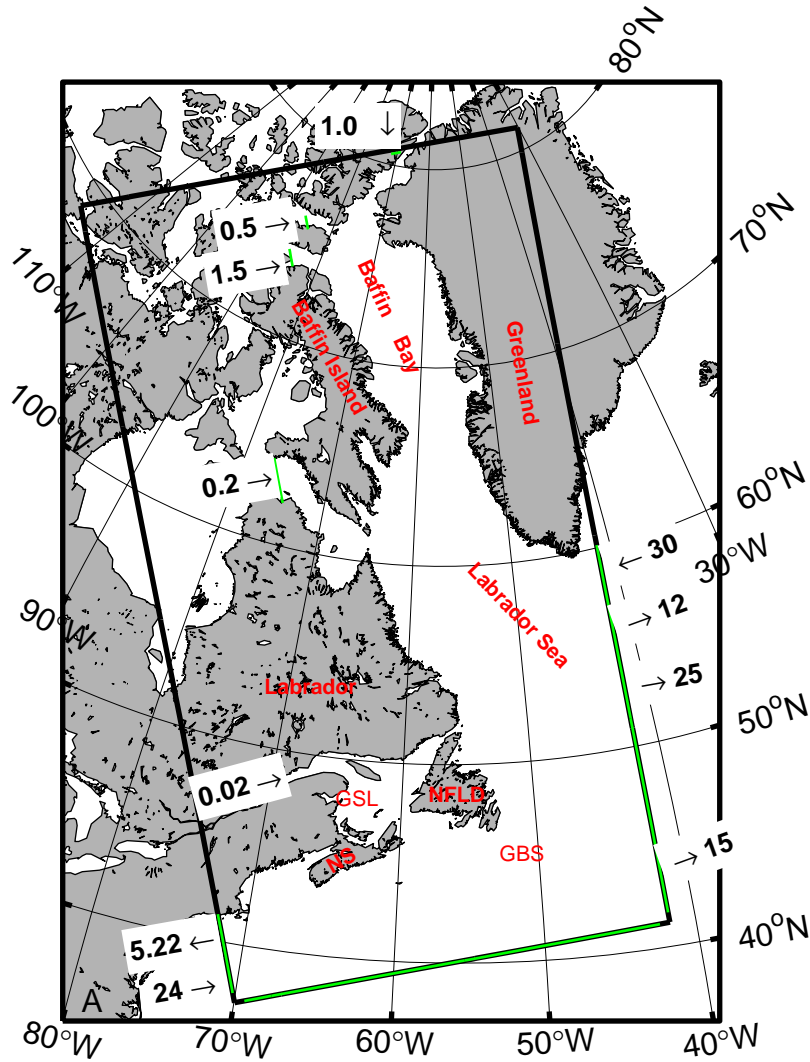

Fig. 1 Map showing model domain, open boundaries. The black dash line represents the model domain. The green lines represent the exterior open boundaries. The arrows and the number show the directions and the barotropic transports. The unit is Sv ($1 \text{ Sv} = 10^6 \text{ m}^3 \text{ s}^{-1}$). The abbreviations are: GBS - the Grand Banks; NFLD - Newfoundland; NS - Nova Scotia; GSL - the Gulf of St. Lawrence.

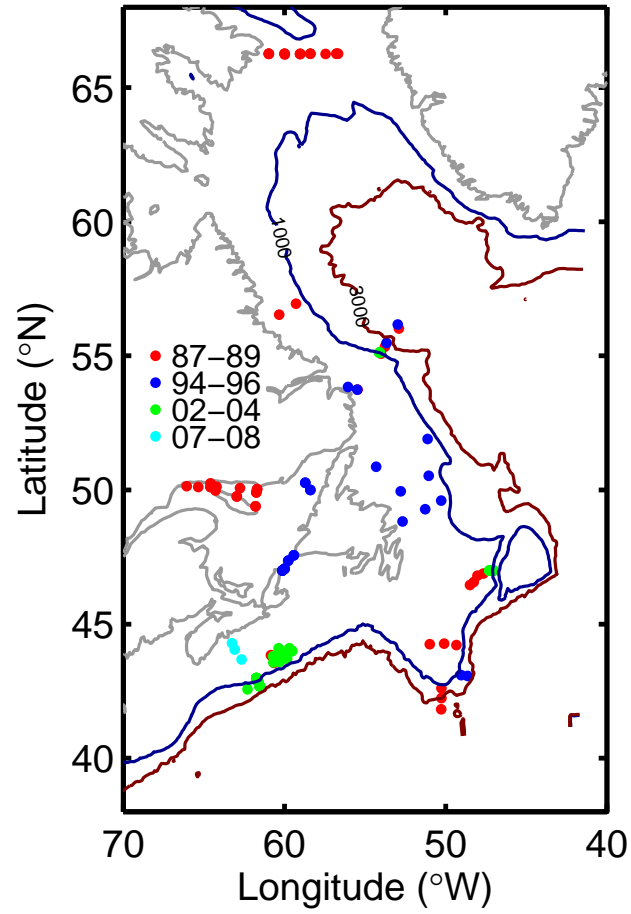

Fig. 2 Sites of current meter in 1987-1989 (red), 1994-1996 (blue), 2002-2004 (green) and 2007-2008 (cyan). The two contour lines represent the 1000 m and 3000 m bottom topography, respectively

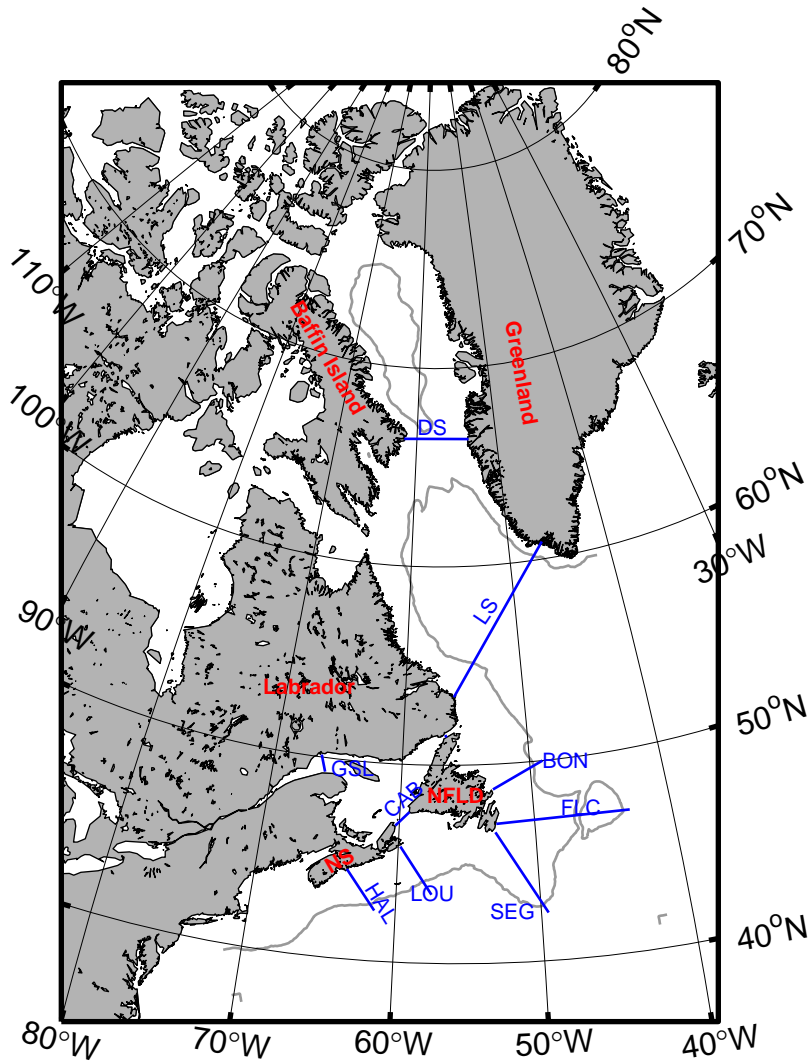

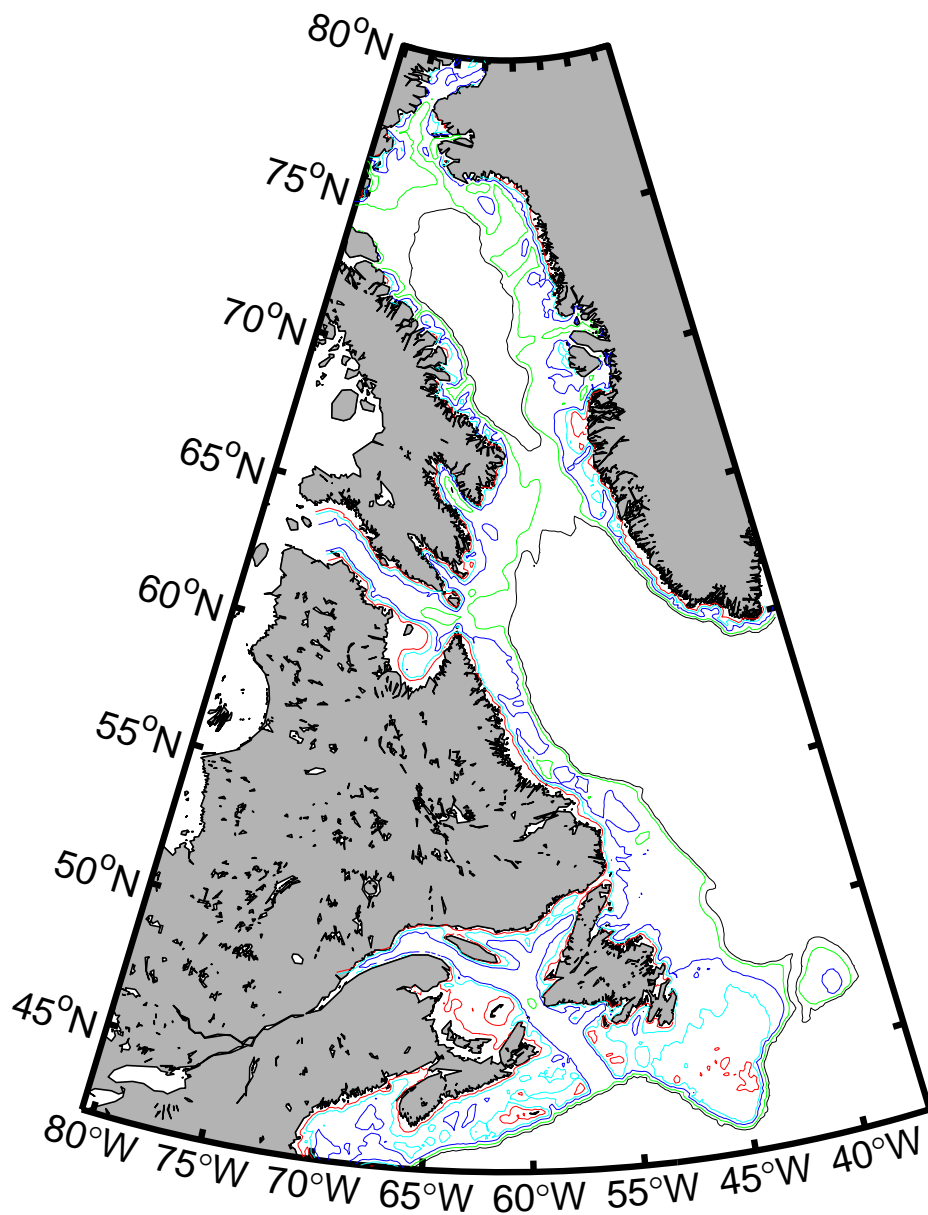

Fig. 3. Locations of vertical sections. DS–Davis Strait; LS–Labrador Sea Section; BON–Bonavista Section; FLC–Flemish Cap Section; SEG–Southeast Grand Banks Section; LOU–Louisbourg Section; HAL–Halifax Section; CAB–Cabot Strait Section; GSL–Northwest Gulf of St. Lawrence Section. The grey line is the 1000 m bottom contour.
