## **Canadian Manuscript Report of Fisheries and Aquatic Sciences**

Manuscript reports contain scientific and technical information that contributes to existing knowledge but which deals with national or regional problems. Distribution is restricted to institutions or individuals located in particular regions of Canada. However, no restriction is placed on subject matter, and the series reflects the broad interests and policies of Fisheries and Oceans Canada, namely, fisheries and aquatic sciences.

Manuscript reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in the data base *Aquatic Sciences and Fisheries Abstracts*.

Manuscript reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page.

Numbers 1-900 in this series were issued as Manuscript Reports (Biological Series) of the Biological Board of Canada, and subsequent to 1937 when the name of the Board was changed by Act of Parliament, as Manuscript Reports (Biological Series) of the Fisheries Research Board of Canada. Numbers 1426 - 1550 were issued as Department of Fisheries and Environment, Fisheries and Marine Service Manuscript Reports. The current series name was changed with report number 1551.

## **Rapport manuscrit canadien des sciences halieutiques et aquatiques**

Les rapports manuscrits contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais qui traitent de problèmes nationaux ou régionaux. La distribution en est limitée aux organismes et aux personnes de régions particulières du Canada. Il n'y a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques de Pêches et Océans Canada, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports manuscrits peuvent être cités comme des publications à part entière. Le titre exact figure au-dessus du résumé de chaque rapport. Les rapports manuscrits sont résumés dans la base de données *Résumés des sciences aquatiques et halieutiques*.

Les rapports manuscrits sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre.

Les numéros 1 à 900 de cette série ont été publiés à titre de Manuscrits (série biologique) de l'Office de biologie du Canada, et après le changement de la désignation de cet organisme par décret du Parlement, en 1937, ont été classés comme Manuscrits (série biologique) de l'Office des recherches sur les pêcheries du Canada. Les numéros 901 à 1425 ont été publiés à titre de Rapports manuscrits de l'Office des recherches sur les pêcheries du Canada. Les numéros 1426 à 1550 sont parus à titre de Rapports manuscrits du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 1551.

## ABSTRACT

Williams, D.C., Nottingham, M.K., Olsen, N. and Wyeth, M.R. 2017. Summary of the Hecate Strait synoptic bottom trawl survey, May 28 – June 23, 2013. Can. Manusc. Rep. Fish. Aquat. Sci. 3142: viii + 60 p.

A bottom trawl survey of Hecate Strait was conducted on the Canadian Coast Guard Ship W. E. Ricker between May 28 and June 23, 2013. The Hecate Strait synoptic bottom trawl survey was first conducted in 2005, and has been repeated every second year since. This survey is one of a set of long-term and coordinated surveys that together cover the continental shelf and upper slope of most of the British Columbia coast. The objectives of these surveys are to provide fishery-independent abundance indices of all demersal fish species available to bottom trawling and to collect biological samples of selected species.

The survey follows a random depth-stratified design and the sampling units are 2 km by 2 km blocks. One hundred and seventy-five (90.7 %) of the 193 blocks assessed in 2013 were successfully fished. The mean catch per tow was 463 kg. The average number of species per tow was 22. The most abundant fish species encountered was Arrowtooth Flounder (*Reinhardtius stomias*), followed by Spotted Ratfish (*Hydrolagus colliei*), English Sole (*Parophrys vetulus*), Dover Sole (*Microstomus pacificus*), and Southern Rock Sole (*Lepidopsetta bilineata*). Biological data including individual length, weight, sex, maturity, and ageing structures were collected from selected species. Biological samples were collected from a total of 68 different species of fish. Oceanographic data, including water temperature, depth, salinity, and dissolved oxygen were also recorded for most tows.

## RÉSUMÉ

Williams, D.C., Nottingham, M.K., Olsen, N. and Wyeth, M.R. 2017. Relevé synoptique au chalut de fond dans le détroit d'Hecate, du 28 mai - 23 Juin 2013. Rapp. manus. can. sci. halieut. Aquat. 3142: viii + 60 p.

Un relevé au chalut de fond dans le détroit d'Hecate a été effectué par le navire de la Garde côtière canadienne *W. E. Ricker* entre le 28 mai et le 23 juin 2013. Le premier relevé synoptique au chalut de fond dans le détroit d'Hecate a été réalisé en 2005, et depuis l'opération est répétée tous les deux ans. Le relevé du détroit d'Hecate fait partie d'un ensemble de relevés à long terme et coordonnés couvrant le plateau continental et le haut du talus continental de la majorité de la côte de la Colombie-Britannique. Ces relevés servent à obtenir des indices d'abondance indépendants de la pêche pour toutes les espèces de poissons démersaux pouvant être pêchées au chalut de fond, ainsi qu'à prélever des échantillons biologiques sur des d'espèces précises.

Ce relevé est réalisé selon un plan d'échantillonnage aléatoire stratifié, et les unités d'échantillonnage sont des blocs de deux kilomètres carrés. Parmi les 193 blocs évalués en 2013, 175 (90.7 %) ont fait l'objet d'une pêche. La moyenne de prises par trait était de 463 kg. Le nombre moyen d'espèces par trait était de 22. Les espèces de poissons capturées le plus fréquemment étaient la plie à grande bouche (*Reinhardtius stomias*), suivi de la chimère tachetée (*Hydrolagus colliei*), de la sole limande (*Parophrys vetulus*), de la sole de Douvres (*Microstomus pacificus*), et de la sole du Pacifique (*Lepidopsetta bilineata*). On a recueilli les données biologiques des espèces sélectionnées, notamment la longueur, le poids, le sexe, la maturité et la structure par âge. Les échantillons ont été prélevés sur un total de 68 espèces de poissons différentes. Les données océanographiques, notamment la température de l'eau, la profondeur, la salinité et la teneur en oxygène dissous, ont également été consignées pour la plupart des traits.

Left Blank on Purpose

## INTRODUCTION

In 2003, a report by the Pacific Scientific Advice Review Committee recommended development of fishery-independent relative abundance indices using bottom trawl surveys in British Columbia waters (Sinclair et al. 2003). The report recommended that, as an initial step, a pilot survey be conducted in Queen Charlotte Sound (Figure 1). The survey design was synoptic in that it was intended to provide indices for as many species as possible rather than focusing on a limited number of target species.

The first Queen Charlotte Sound synoptic bottom trawl survey (QCS) was successfully completed in the summer of 2003 (Olsen et al. 2007). Following that, additional surveys were planned for the west coast of Vancouver Island (WCVI) beginning in 2004, Hecate Strait (HS) beginning in 2005, and the west coast of Haida Gwaii (WCHG, previously Queen Charlotte Islands) beginning in 2006. These surveys are conducted on a rotating biennial schedule with the Queen Charlotte Sound and Hecate Strait surveys conducted in odd-numbered years and the West Coast Vancouver Island and West Coast Haida Gwaii surveys conducted in even-numbered years. These four synoptic bottom trawl surveys provide comprehensive coverage of the continental shelf and upper slope of the British Columbia coast (Figure 1). Surveys are conducted on both chartered commercial fishing vessels as well as Canadian Coast Guard research trawlers.

The first HS synoptic bottom trawl survey was successfully completed in 2005 (Workman et al. 2008) and has been repeated every second year since. This document provides a brief summary of the results and methods from the fifth HS synoptic bottom trawl survey which occurred between May 28 and June 23, 2013. It is not intended as a comprehensive review of the survey, nor does it provide interpretive analysis of the survey results. Previous HS synoptic bottom trawl surveys are summarized in Workman et al. 2008, Olsen et al. 2009a, Olsen et al. 2009b and Nottingham et al. 2017.

## METHODS

### SURVEY DESIGN

The survey area is Hecate Strait, from approximately 52° 40' North latitude to 54° 40' North latitude and westward into Dixon Entrance to approximately 133° 00' West longitude. The southern region of this survey is nearly contiguous with the most northerly extent of the Queen Charlotte Sound survey (Figure 1).

#### Depth Strata

All of the synoptic bottom trawl surveys along the British Columbia coast have followed the same random depth-stratified design. Each survey area is divided into 2 km by 2 km blocks and each block is assigned one of four depth strata based on the average bottom depth in the block. The four depth strata vary between areas. The depth strata for the HS synoptic bottom trawl survey are 10-70 m, 70-130 m, 130-220 m, and 220-500 m (Table 1). For each survey in the HS series, blocks are randomly selected within each depth strata.

#### Block Allocation

Following the methods in Sinclair et al. (2003), commercial fishery catch data were used to model the expected groundfish catches prior to the first survey in each area. The target number of tows in each stratum was based on providing the most precise catch rate indices for as many species as possible. However, in any given year, not all of the randomly selected blocks will be fishable. Further, after the inaugural survey, a block that has been fished in a previous year may be selected. The results of previous surveys in each area are used to estimate both the expected proportion of blocks in each stratum that would not result in a useable tow (predicted failure rate) as well as the expected probability of returning to a block that was successfully fished in a previous survey (predicted revisit rate). The predicted failure and revisit rates are combined into a single probability for each survey area and depth stratum. These probabilities are then used to calculate the anticipated number of blocks per stratum required to complete the target number of tows.

When a synoptic bottom trawl survey is conducted on a chartered commercial fishing vessel the contract is structured such that the survey will continue until the entire set of blocks that have been selected are assessed. Assuming that the predicted failure and revisit rates prove to be accurate, at the end of the survey the final distribution of tows in each strata should match the initial target allocation that was modeled based on the commercial fishing data.

Canadian Coast Guard research vessel time is allocated amongst various users so each year only a set number of days are available for the synoptic bottom trawl surveys. The operational model that is used for chartered vessels will not work in such a scenario. Instead, we try to fish as many blocks as possible while maintaining the target relative allocation of tows amongst strata. First, the total number of blocks that can be assessed in the number of available fishing days is estimated. Then, using the target relative allocation of tows and the predicted failure and revisit rates, various total “target”

numbers of tows are tested until the total allocated blocks matches the number of blocks that can be assessed in the time available.

As indicated above, the start and end dates for trips on Canadian Coast Guard ships are determined in advance. However, it may not be possible to fish on some days due to weather, mechanical breakdowns, or unforeseen events such as responding to search and rescue calls. Those days are lost, so if the entire set of selected blocks is started and it is not possible to fish on a number of days, part of the survey area could be missed. To avoid such a situation, the selected blocks are divided into a primary set and a secondary set. The primary set consists of two-thirds of the total blocks and is visited first. In early years of the survey, both the primary and secondary tows of blocks were created before the start of the survey. The primary set was visited first and then the secondary set would be visited once the primary set was almost completed. The secondary set could be adjusted by randomly either adding or removing blocks, depending on the remaining fishing days. This method invariably created some confusion on board the vessel when the secondary set was adjusted mid-trip. In 2011, the practice was slightly altered. Improvements to the at-sea software facilitated the generation of blocks so at the start of the survey only the primary set of blocks was created. The secondary set of blocks was then added once the primary set was nearly complete. The number of blocks in secondary set would be based on the number of remaining fishing days.

For the 2013 HS survey, 198 blocks were randomly selected based on 9 blocks a day and 22 days available for fishing (Table 1). The primary set consisted of 132 blocks while the secondary set was anticipated to be 66 blocks.

## VESSEL

The survey was conducted aboard the Canadian Coast Guard Ship W.E. Ricker, a 58 m research stern trawler (Figure 2).

## FISHING GEAR

The research trawl was an Atlantic Western IIA box trawl net connected to 1,100 kg U.S.A. Jet doors (Figure 3). The net was thoroughly cleaned between tows to prevent cross-contamination of catches. The net was also inspected for damage after every tow. If the net was damaged, it was repaired and restored to its original dimensions prior to resuming fishing. Two nets were rigged at the start of the survey so that if one net was damaged beyond what could be immediately repaired, the second one could be used.

The net includes a main body (wing and belly sections), two lengthening pieces, and a codend with liner (Figure 4 and Figure 5). The main body of the net has an 11 mm long-link steel chain frame and is constructed from a mix of double 4.5 mm strand 5 inch web, single 3.5 mm strand 5 inch web, and single 3.5 mm strand 4 ½ inch web (Figure 6). The intermediate sections are constructed from single 4.5 mm strand 4½ inch web (Figure 7). All web in the main body and lengthening pieces is constructed from a compacted strand braided polyethylene (Euroline Premium). The codend is constructed from double 5 mm strand 4 inch regular braided polyethylene web with a ½ inch 210/20 knotless nylon liner (Figure 7).

The Rockhopper footgear includes flying wing, mid wing, bunt wing, and bosom sections (Figure 8). The bosom section is built from 16 inch diameter (worn 18 inch) aircraft tires, while the bunt and mid wing sections have 16 inch Rockhopper disks. The flying wings have 5 inch rubber disks with swivel center 16 inch solid bunt bobbins at each end.

The specifications of net and footgear components are shown in Table 2 and dimensions for the assembled trawl pieces are shown in Figure 6 through Figure 8.

## **SCHE**DULE

The survey was split into two sections or “legs” of 13-15 days in duration with six to seven science staff on each. The science crew change was on June 6 (Table 3).

## **FISHING PROTOCOL**

Fishing operations were carried out based on the ship’s 12 hour crew rotation commencing at approximately 0700 hrs and ending at approximately 2000 hrs each day. By following this schedule, survey fishing was limited to daylight hours. Catch processing often continued after fishing operations were completed for the day.

Prior to fishing, the selected blocks were reviewed by the fishing master and chief scientist to determine a candidate set to visit each day. During this review process, one or more blocks might be determined not fishable by the fishing master based on his experience and knowledge of the area. In such cases the blocks were marked as “rejected based on prior knowledge”. After compiling a list of blocks to be visited, the most efficient route of travel between blocks would be planned.

The fishing master was asked to inspect each selected block and find a suitable tow location using the following criteria:

1. All tows should follow a depth contour.
2. If a block had been fished in a previous year, follow the same track so as to minimize the survey footprint.
3. If a block had not been fished in a previous year, make a tow entirely within the block and pass through the center point of the block.
4. If it is not possible to make a tow through the center of the block, make a tow entirely within the block that passes as close to the center as possible.
5. If it is not possible to make a tow entirely within the block, make a tow such that at least 50 % of the tow is within the block.

The target tow length was 20 minutes long. The tow start was defined as the time at which the net mensuration data indicated stable bottom contact and the headline collapsed to 3-4 m above the bottom. After 19 minutes had elapsed, net haul back was initiated. The extra minute was intended to account for uptake of slack in the main warps. Although the target on-bottom time was 20 minutes, tows that were at least 14 minutes in length were accepted. This was a pragmatic decision that allowed for retention of many tows that would otherwise have been unusable due to hang-ups or early haul-backs.

Tows were conducted at a target speed of 2.8 to 3.0 nautical miles per hour (5.2 - 5.6 km/hr). When retrieving the net, the fishing master was asked to maintain a water velocity through the net that was consistent with the rest of the tow.

Tows were made in the target depth stratum of the block. If the only possible tow was in a different depth stratum than that assigned to the block, then the tow was conducted, and the block was reassigned to the appropriate depth stratum.

If it was not possible to find a suitable tow location then the block was marked as “rejected based on on-ground inspection.” The vessel would then move on to the next selected block.

The result of trawling was either a useable or unusable tow. The most common reasons for deeming a tow unusable were a hang-up of the fishing gear, tear-up of the trawl net, or not achieving the minimum bottom contact time. In the event of an unusable tow, additional attempts to fish the block could be made at either the same location or a different location within the block. Alternatively, the block could be deemed unfishable, in which case it was rejected.

If fishing was attempted in a block, the final status of the block would be either “successfully fished on first attempt”, “successfully fished after multiple attempts”, or “rejected after last attempt failed”. Rejected blocks were removed from the sampling frame for all future surveys. This will increase the efficiency of subsequent surveys, as less time will be spent inspecting blocks that cannot be fished. Some selected blocks may not have been successfully fished but may also not have been rejected. This could occur when a temporary obstacle (e.g. trap fishing gear, another vessel, or strong tidal currents) prevents fishing, or when there was insufficient time available to fish a block without spending another day in the area, or if fishing was attempted and although the tow was not successful, the block was not rejected. These blocks would be considered unassessed at the end of the survey and have a final status of “block not fished but remains in sampling frame” or “not rejected but last attempt failed”.

### **Fishing Data**

The start and end positions, times, and bottom depths, as well as the direction, vessel speed, weather and environmental conditions, and warp length were recorded for every tow. In addition, global positioning system (GPS) data and bottom sounder data were logged continuously for the duration of the survey.

### **CATCH PROCESSING**

At the end of each tow the net was retrieved and the catch dumped into a hopper which emptied into the wetlab below the trawl deck. Catch was sorted in the wetlab by species into separate baskets as it moved along a conveyor system. The catch from all tows, including both useable and unusable tows was recorded. Unusable tows, although not sampled for biological data, were recorded to track catch amounts. Whenever possible, the catch was completely sorted and weighed. However, for large catches in excess of 2000 kg or for catches with large numbers of small individuals, some method of total catch estimation and sub-sampling for species composition was conducted. The specific method of catch estimation and sub-sampling varied based on the total weight

and volume of the catch being subsampled as well as the composition of the catch. Large catches were typically visually estimated, although volumetric estimates were sometimes used. In all cases a representative sample of the catch was sorted to determine species composition and to provide individuals for biological sampling.

Baskets of species were weighed to the nearest 0.02 kg using a motion-compensating electronic balance. For small catches the number of individuals was often recorded in addition to the weight. Weights less than 0.02 kg were recorded as trace amounts. Catch was sorted to the lowest taxonomic group possible. For most fishes this was to the level of species although small and fragile species such as snailfish, lantern fish, or some young-of-the-year rockfish may have only been identified to genus or family. In some cases a few representative individuals may have been frozen for later identification. Invertebrates may have only been identified to phylum or order.

## BIOLOGICAL SAMPLING

While the primary purpose of the survey was to generate fishery-independent indices of relative abundance, the secondary goal was to collect biological information to characterize the size, sex, and age-composition of each species caught. Two types of biological samples were conducted: “Length” samples, consisting of individual fish length and sex, and “Age” samples, consisting of length, sex, weight, maturity, and age structure. In an effort to maintain a manageable workload, each species had a minimum catch level that had to be exceeded in the tow before biological samples would be collected. For rare species or species of special conservation concern the minimum number could be one fish, whereas for common and abundant species the number might be 25 or 50. The choice of the species to collect age samples from depended on the size of the catch of the species and the “desirability” of the species. The size of the catch was considered because the intent was to collect age structures from the largest catches of each species in each stratum over the survey. The “desirability” of the species was based on any conservation concerns and whether or not the species is commercially exploited. Biological samples were typically not collected from unusable tows.

Individual fish were measured to fork length, total length, standard length or other length depending on the species. All length measurements were collected to the nearest 1 cm for length samples, and 0.5 cm for age samples using an electronic fish measuring board. Fish were weighed using a motion-compensating electronic balance. Measurements were to the nearest 1, 2, or 5 grams depending on the size of the fish as well as the model and weight range of the scale in use.

There are a variety of hard parts of a fish that can be used to determine the age of the fish (Chilton and Beamish 1982). The specific structure that provides the most accurate and efficient estimate of age varies by species but all the structures have the common trait of a series of annular rings that can be counted. Sagittal otoliths (calcareous accretions of the inner ear) were collected from rockfish and flatfish species while fin rays were taken from Walleye Pollock (*Theragra chalcogramma*), Lingcod (*Ophiodon elongatus*) and Pacific Cod (*Gadus macrocephalus*). Dorsal spines were collected from North Pacific Spiny Dogfish (*Squalus suckleyi*). All age samples collected on this survey were submitted to the Sclerochronology Lab located at the Pacific Biological Station in Nanaimo, BC for storage and future analysis. In addition to

the biological sampling described above, specific data, specimens or tissue samples are routinely collected following requests from other institutions or researchers. In 2013, samples of whole Spotted Ratfish (*Hydrolagus colliei*), Greenstriped Rockfish (*Sebastes elongatus*), Yellowtail Rockfish (*Sebastes flavidus*), and Arrowtooth Flounder (*Reinhardtius stomias*) were collected. Tissue for DNA analysis was collected from English Sole (*Parophrys vetulus*), Pacific Cod (*Gadus microcephalus*), and Blackspotted (*Sebastes melanostictus*) /Rougheye Rockfish (*Sebastes aleutianus*).

Until the mid-2000s, Rougheye Rockfish (*Sebastes aleutianus*) was considered to be a single, highly variable species with light and dark colour morphs. Genetic and morphological analysis has confirmed that there are two distinct species (Orr and Hawkins 2008): Rougheye Rockfish (*S. aleutianus*) and Blackspotted Rockfish (*S. melanostictus*). Historical biological and catch information for *S. aleutianus* must now be considered to be the aggregate of both species. During the 2008 WCHG survey an attempt was made to differentiate between the two species. That preliminary work showed that the two species cannot be reliably distinguished in the field because the morphological characteristics overlap. Further, there is evidence that the two species hybridize (Gharrett et al. 2005). Given that the historical data is recorded as *S. aleutianus* and that attempting to separate the species at the catch level is both time consuming and unreliable, starting in the fall of 2010, the catch for all surveys was simply recorded as *S. aleutianus*. Then, for every catch, biological samples were collected that included both a visual assessment of the species (*S. aleutianus* or *S. melanostictus*) as well as a tissue sample for genetic confirmation of the species. The survey catch data can then be partitioned into the two species using either the visual assessment or the results of genetic analyses. We do not attempt to partition the catch data for this report.

## NET-MOUNTED SENSORS AND DATA RECORDERS

The W.E. Ricker was equipped with a Notus trawl mensuration system (previous survey years used a Simrad ITI system). Sensors attached to the net use acoustic signals to communicate with each other and the vessel and provide real-time net geometry including headline height and depth, as well as doorspread and wingspread which are used to calculate swept area. The Notus output was logged continuously during the survey and monitored in real-time during fishing operations.

A Mac Marine Industries Bottom Contact Sensor (BCS) was attached to the footrope to record contact with the sea floor. The BCS consists of a pressure housing with an Onset Hobo data recorder in a stainless steel sled that trails behind the footrope. The Hobo recorder measures acceleration in three axes which can then be converted into angles. The recorder is mounted in the sled such that the x-axis tilt indicates the angle of the steel sled. When the footgear contacts the bottom, the sled angle is approximately 80 degrees. When the footrope is off the bottom, the sled hangs down and the angle is approximately 40 degrees. These data are used to determine the exact times in each tow that the trawl net first and last contacted the sea floor, thus providing an accurate measure of total bottom contact time.

A Seabird SBE39 temperature and pressure recorder (TDR) was attached to the starboard wing of the trawl. A Seabird SBE19plus recorder (CTD) with a SBE43 dissolved oxygen sensor was attached to the center of the headline. The SBE19plus

recorded conductivity, temperature and pressure data with derived values for salinity (Seabird, 1989) and depth (Seabird, 2002). The SBE43 recorded oxygen voltage output data with calculated values for dissolved oxygen (ml/l) using temperature, pressure, and salinity data (Seabird, 2012). The SBE39 was activated prior to the first tow of the day and turned off after the last tow of the day, while the SBE19plus and SBE43 were turned on and off manually before and after each tow.

All data recorders were downloaded at the end of each day.

## DATA RECORDING

All the fishing, catch, and biological data were recorded directly into a Microsoft SQL Server database. Details of the electronic data acquisition system used for this survey can be found in Olsen (2010).

All the data from the survey are archived in an Oracle database called “GFBIO”, maintained at the Pacific Biological Station in Nanaimo, BC.

## RESULTS

### FISHING

The 2013 HS synoptic bottom trawl survey was divided into two legs of approximately two weeks. From a total of 28 allotted survey days, three days were required for travel and gear loading/unloading at the start and end of the survey, one day was used to conduct three test sets in Queen Charlotte Strait using the new Notus net mensuration system, and one day was required for science crew change (Table 3).

The initial plan was to assess 198 blocks based on 9 blocks per day and 22 fishing days. However, after completing the primary set of blocks it was clear that there was insufficient time remaining to complete the anticipated secondary set of 66 blocks. Therefore, the secondary set that was actually added consisted of 63 blocks (Table 4).

From the adjusted target of 195 blocks, two were not fished due to time constraints. Of the 193 blocks that were assessed, 175 were successfully fished, 16 were rejected based on on-ground inspections, and two were rejected after one or more failed fishing attempts (Table 4 and Figure 9).

A total of 182 tows, of which 175 were useable, were completed during the 21.5 days that fishing occurred. Table 5 shows tow results by stratum for this survey. Seven tows were not useable due to hang-ups, tear-ups, or insufficient bottom time. The scope (ratio of warp length to bottom depth) used for tows in 2013 is shown in

Table 6 and Figure 10. Complete information for each tow including date, duration, location, average depth, average speed, warp, total catch weight and usability is presented in Appendix A.

### CATCH

A total of 80,559 kg of fish and invertebrates was caught during the 2013 HS survey. The total catch weight for useable tows was typically less than 600 kg per tow and averaged 463 kg per tow (Figure 11). The majority of the catch (78,811 kg, 97.8 %)

consisted of 110 different species of fish, including 28 rockfish and 15 flatfish species. The remainder (1,748 kg) consisted of 132 invertebrate groups. The average number of species identified in useable tows was 22 (Figure 12). The frequency of occurrence, maximum catch weight, mean catch weight per tow, and total survey catch weight of each species are shown in Table 7. Of the fish species caught, Arrowtooth Flounder (*Reinhardtius stomias*), was the most dominant by weight, followed by Spotted Ratfish (*Hydrolagus colliei*), English Sole (*Parophrys vetulus*), Dover Sole (*Microstomus pacificus*), and Southern Rock Sole (*Lepidopsetta bilineata*). Catch weights by tow for the 50 most commonly encountered species in this survey are included in Appendix B.

## BIOLOGICAL SAMPLES AND SPECIMENS

Biological samples were collected from a total of 30,672 individuals of 68 species of fish. The number of samples and recorded biological attributes per species is shown in Table 8. A summary of the biological data collected for each species is shown in Table 9.

## NET-MOUNTED SENSORS AND DATA RECORDERS

Notus net mensuration data were collected from 179 tows (Table 10).

Seabird SBE39 data (water temperature and depth), Seabird SBE19plus and SBE43 data (conductivity, water temperature, depth and dissolved oxygen) were collected from 182 tows (Table 10 and Figure 13).

BCS data were collected from 171 tows (Table 10). An example of data collected by the BCS is shown in Figure 14.

Global positioning system (GPS) data and bottom sounder data are available for all 182 tows.

## ACKNOWLEDGEMENTS

Thank-you to the captain and crew of the CCGS W.E. Ricker and the science staff that participated in the survey.

Table 2. Atlantic Western IIa box trawl net specifications for the 2013 HS synoptic bottom trawl survey.

Component	Dimension
Wings, square, and bottom belly netting	combination of 5 inch double strand 4.5mm Euroline Premium and 5 inch single strand 3.5 mm Euroline Premium
Belly netting	4 ½ inch single strand 3.5mm Euroline Premium
Lengthening piece netting	4 ½ inch single strand 4.5 mm Euroline Premium
Codend netting	4 inch double 5 mm orange braided polyethylene
Codend liner	½ inch 210/20 knotless nylon
FLOATS	8 inch diameter center hole rated to 2000 m
Net frame chain	11 mm long link (64 mm inner length) grade 80 steel chain
Net frame rope	1 inch 3-strand twisted Polysteel
Net frame rope to chain lashing	3/8 inch 3-strand twisted Esterpro
Riblines	1 ¼ inch 3-strand twisted Polysteel
Footgear bosom	16 inch diameter tires (worn 18 inch aircraft tires)
Rubber spacers	4 inch, 5 inch, and 6 inch diameter disks cut from tires
Footgear wing center chain	16 mm mid link (65 mm inner length) grade 80 steel chain
Footgear wing top chain	11 mm long link (64 mm inner length) grade 80 steel chain
Rockhopper disk	16 inch diameter
Solid rubber bunt bobbin with steel tube center	16 inch diameter by 10 inch
Steel toggles	5 inch diameter by 3 inch long with 13 inches of chain (from center of toggle)

Table 10. Summary of data from net-mounted recorders during the 2013 HS synoptic bottom trawl survey, showing the number of tows and total number of records. A total of 182 survey tows were conducted, of which 175 were useable.

<b>Data Recorder</b>	<b>Attribute</b>	<b>Number of</b>	
		<b>Tows</b>	<b>Records</b>
Mac Marine Industries Bottom Contact Sensor	Bottom Contact Sensor tilt angle	171	43297
Notus Trawl Mensuration System	Doorspread (m)	179	34010
	Headline height above bottom (m)	179	34010
Seabird Sbe19plus Seacat Profiler	Conductivity of sea water (S/m)/ salinity (PSU)	182	34276
	Water temperature (°C)	182	34276
	Pressure (db)/ depth (m)	182	34276
Seabird SBE43	Oxygen voltage (V)/ dissolved oxygen (ml/L)	182	34276
Seabird SBE39 Temperature And Pressure Recorder	Water temperature (°C)	182	67690
	Pressure (db)/ depth (m)	182	67690

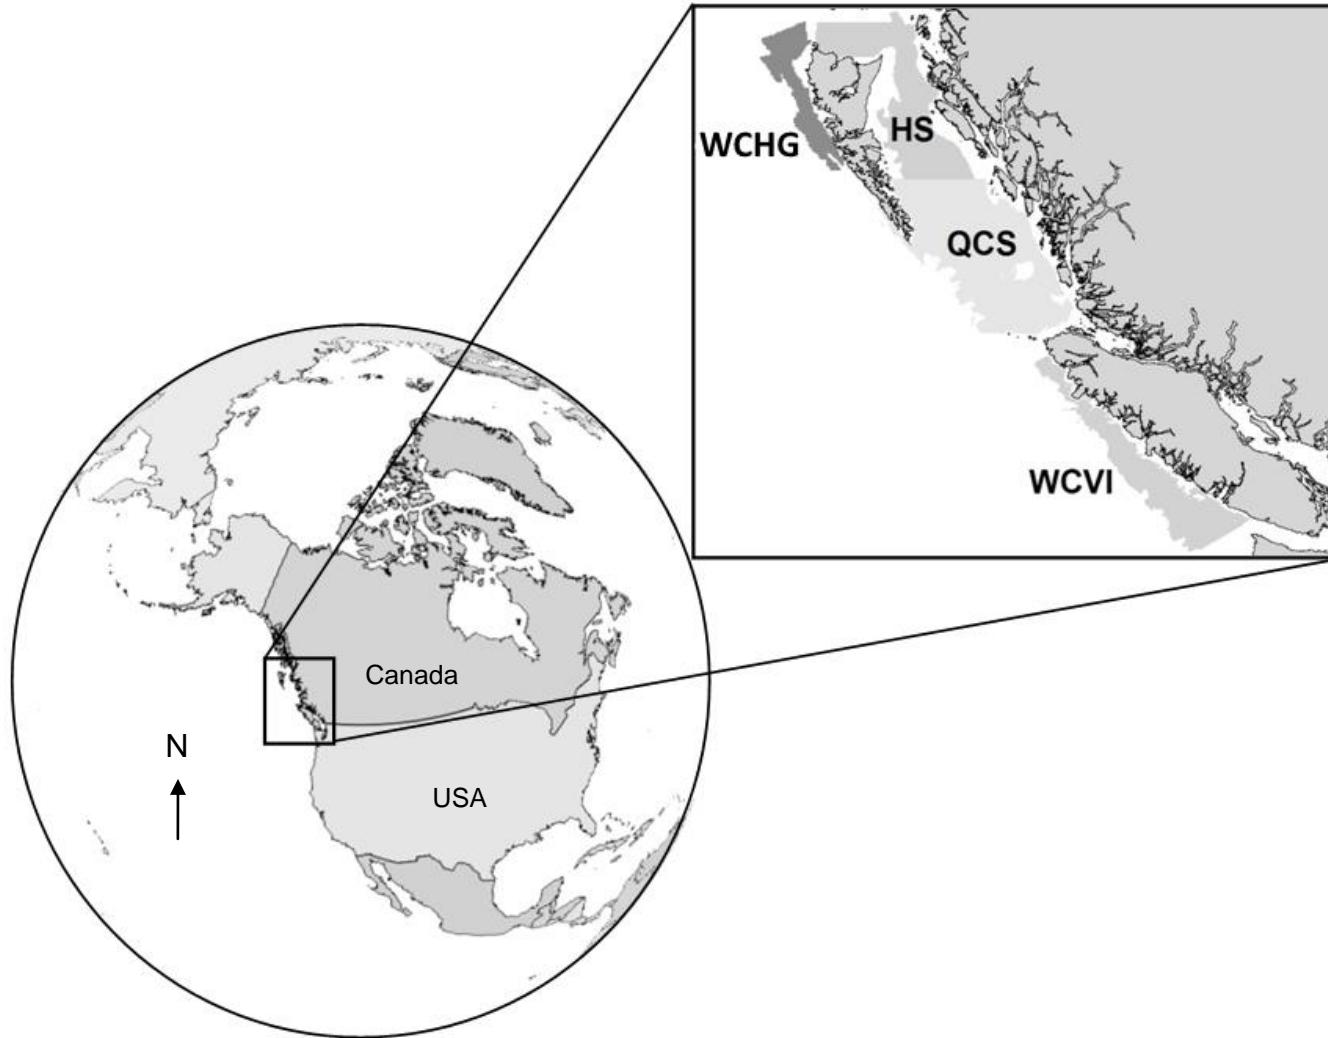

Figure 1. Locations of the current synoptic bottom trawl surveys on the coast of British Columbia, Canada. WCHG = West Coast Haida Gwaii; HS = Hecate Strait; QCS = Queen Charlotte Sound; WCVI = West Coast Vancouver Island.

Figure 2. The Canadian Coast Guard Ship W.E. Ricker used for the 2013 HS synoptic bottom trawl survey.

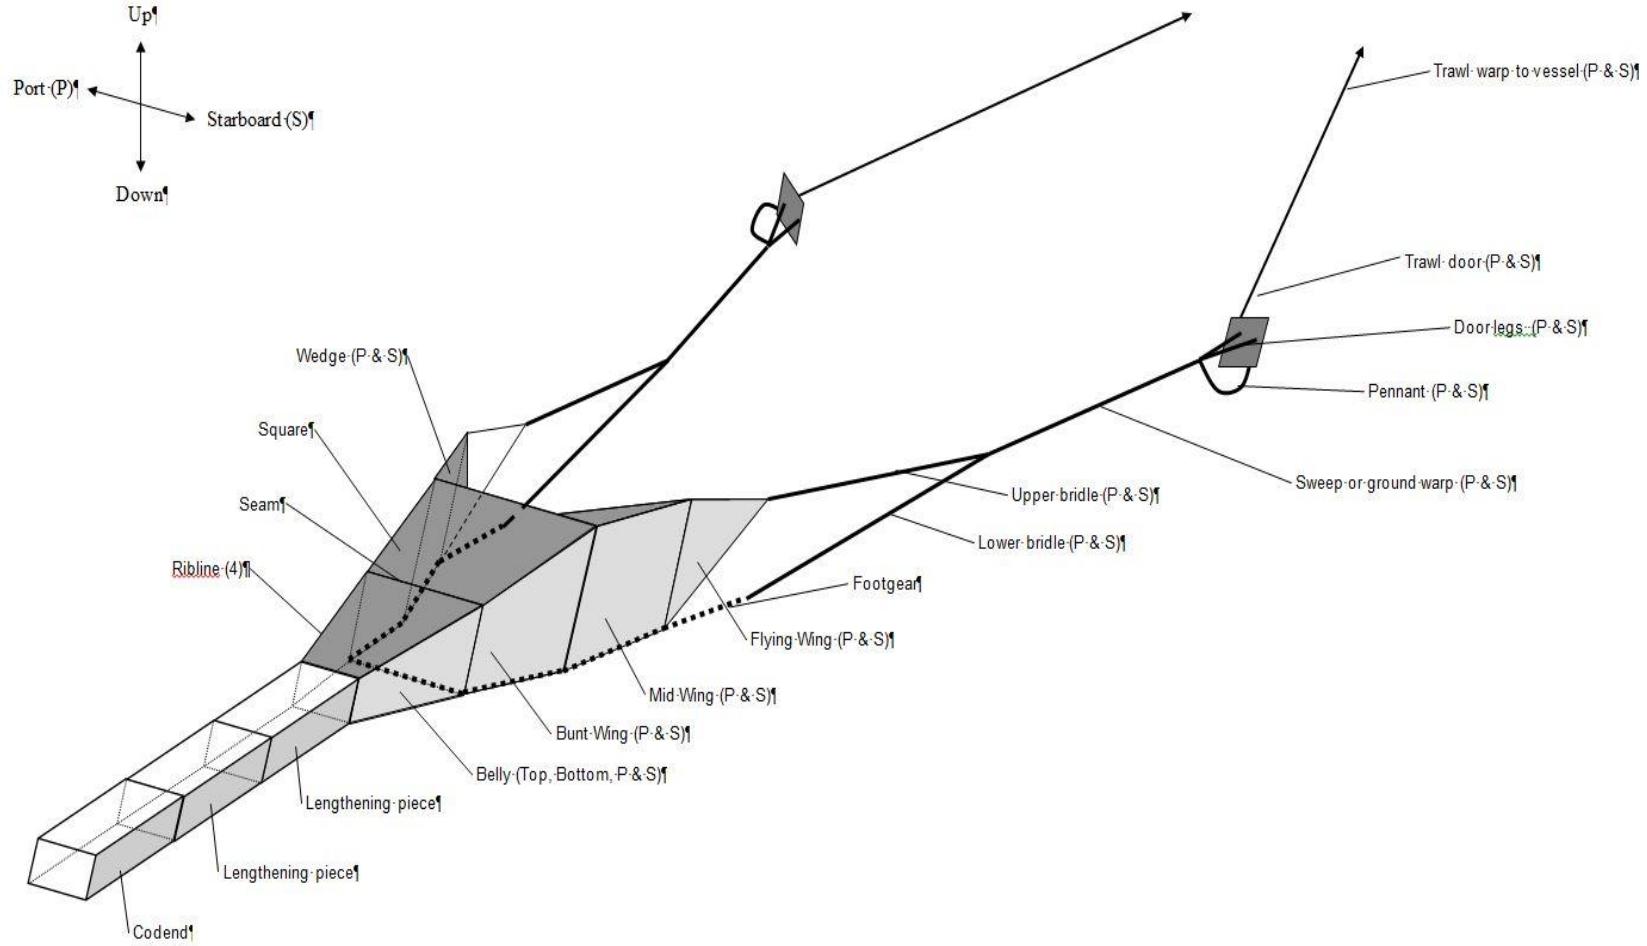

Figure 3. Overview diagram of the Atlantic Western IIa box trawl used on the 2013 HS synoptic bottom trawl survey.

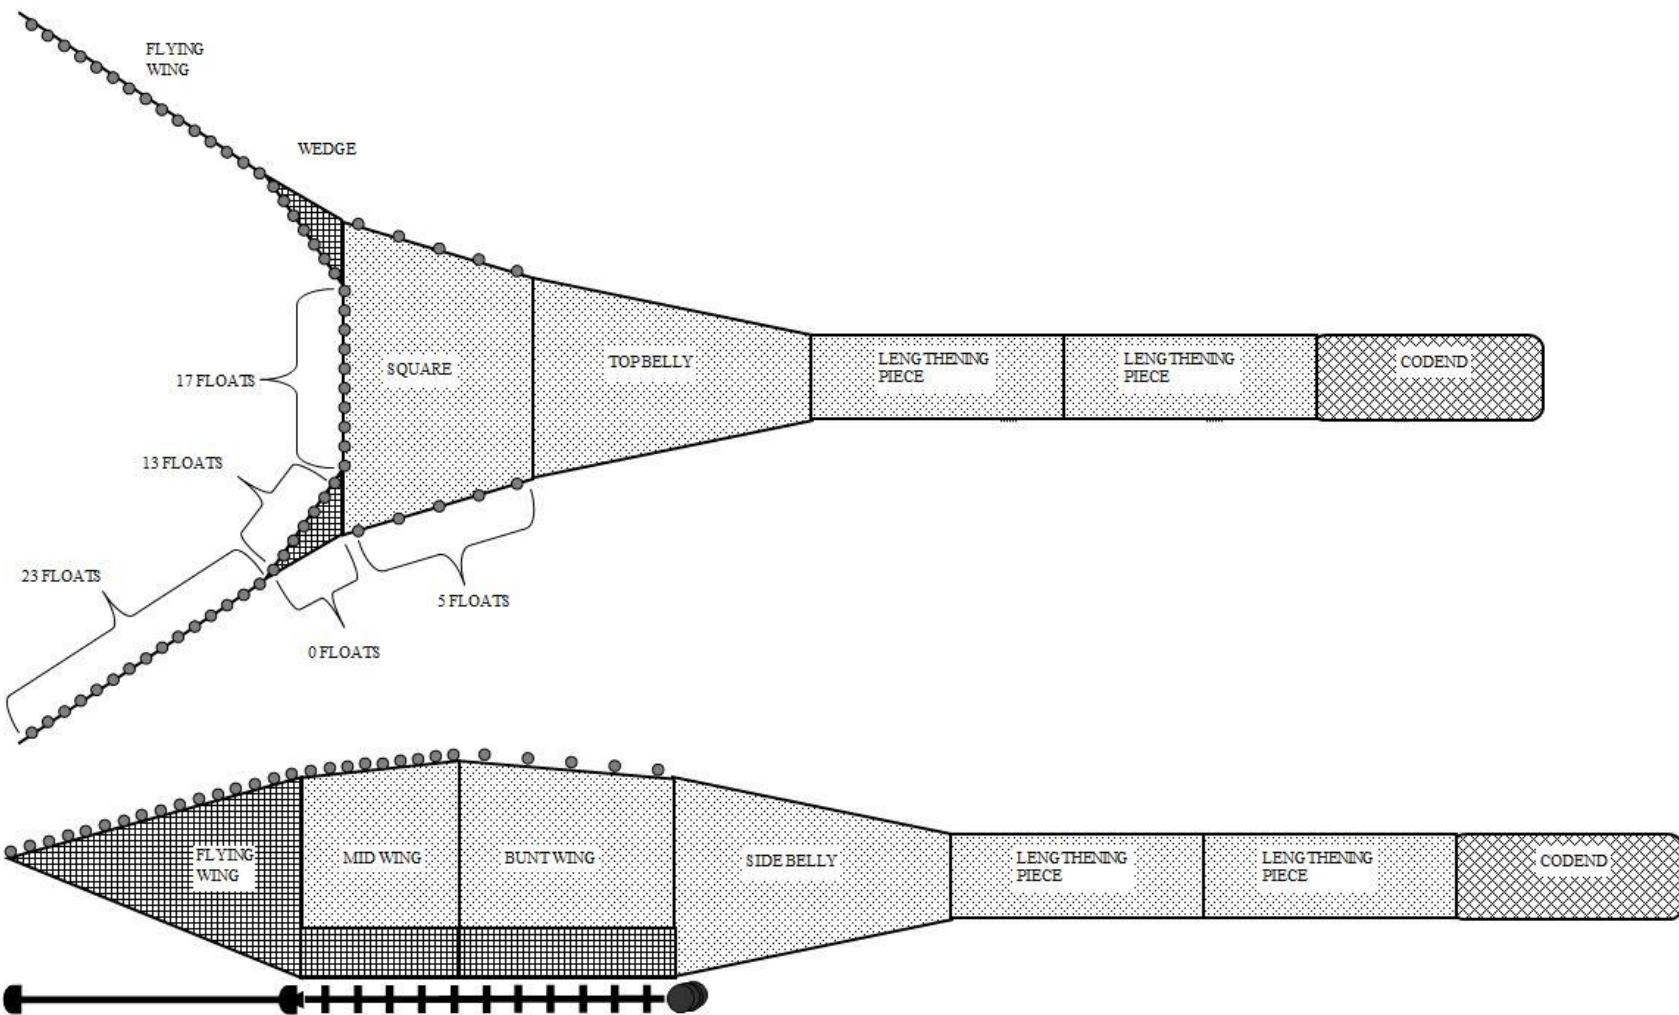

Figure 4. Top and side view of the Atlantic Western IIa box trawl used on the 2013 HS synoptic bottom trawl survey.

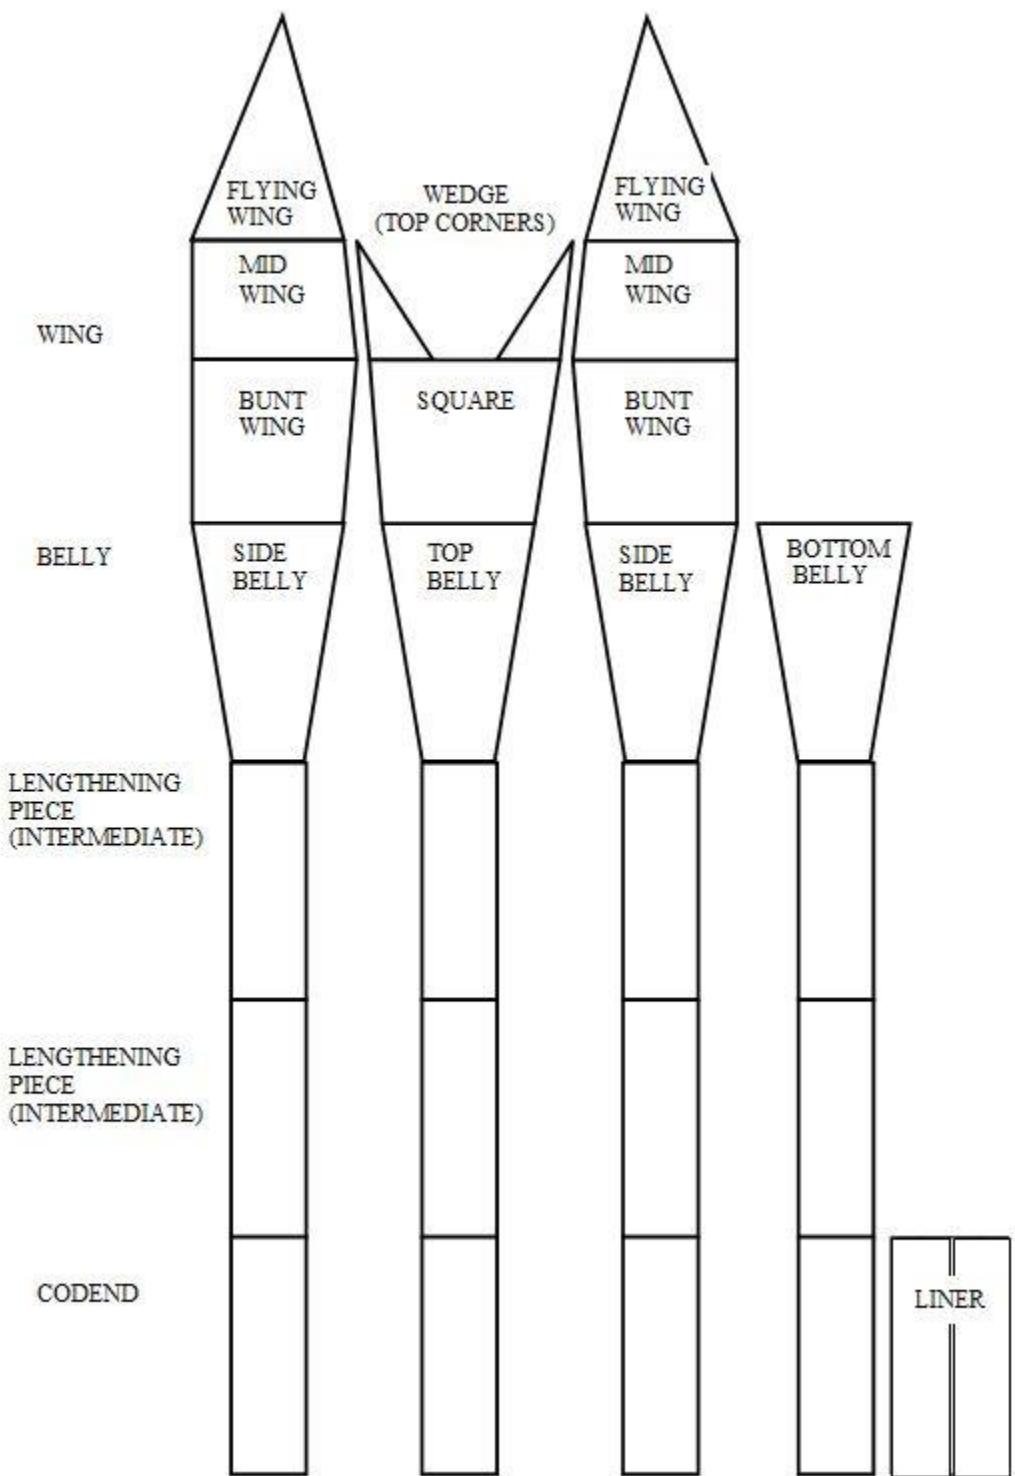

Figure 5. Diagram of the net panels with section names for the Atlantic Western IIa box trawl used on the 2013 HS synoptic bottom trawl survey.

Left Blank on Purpose

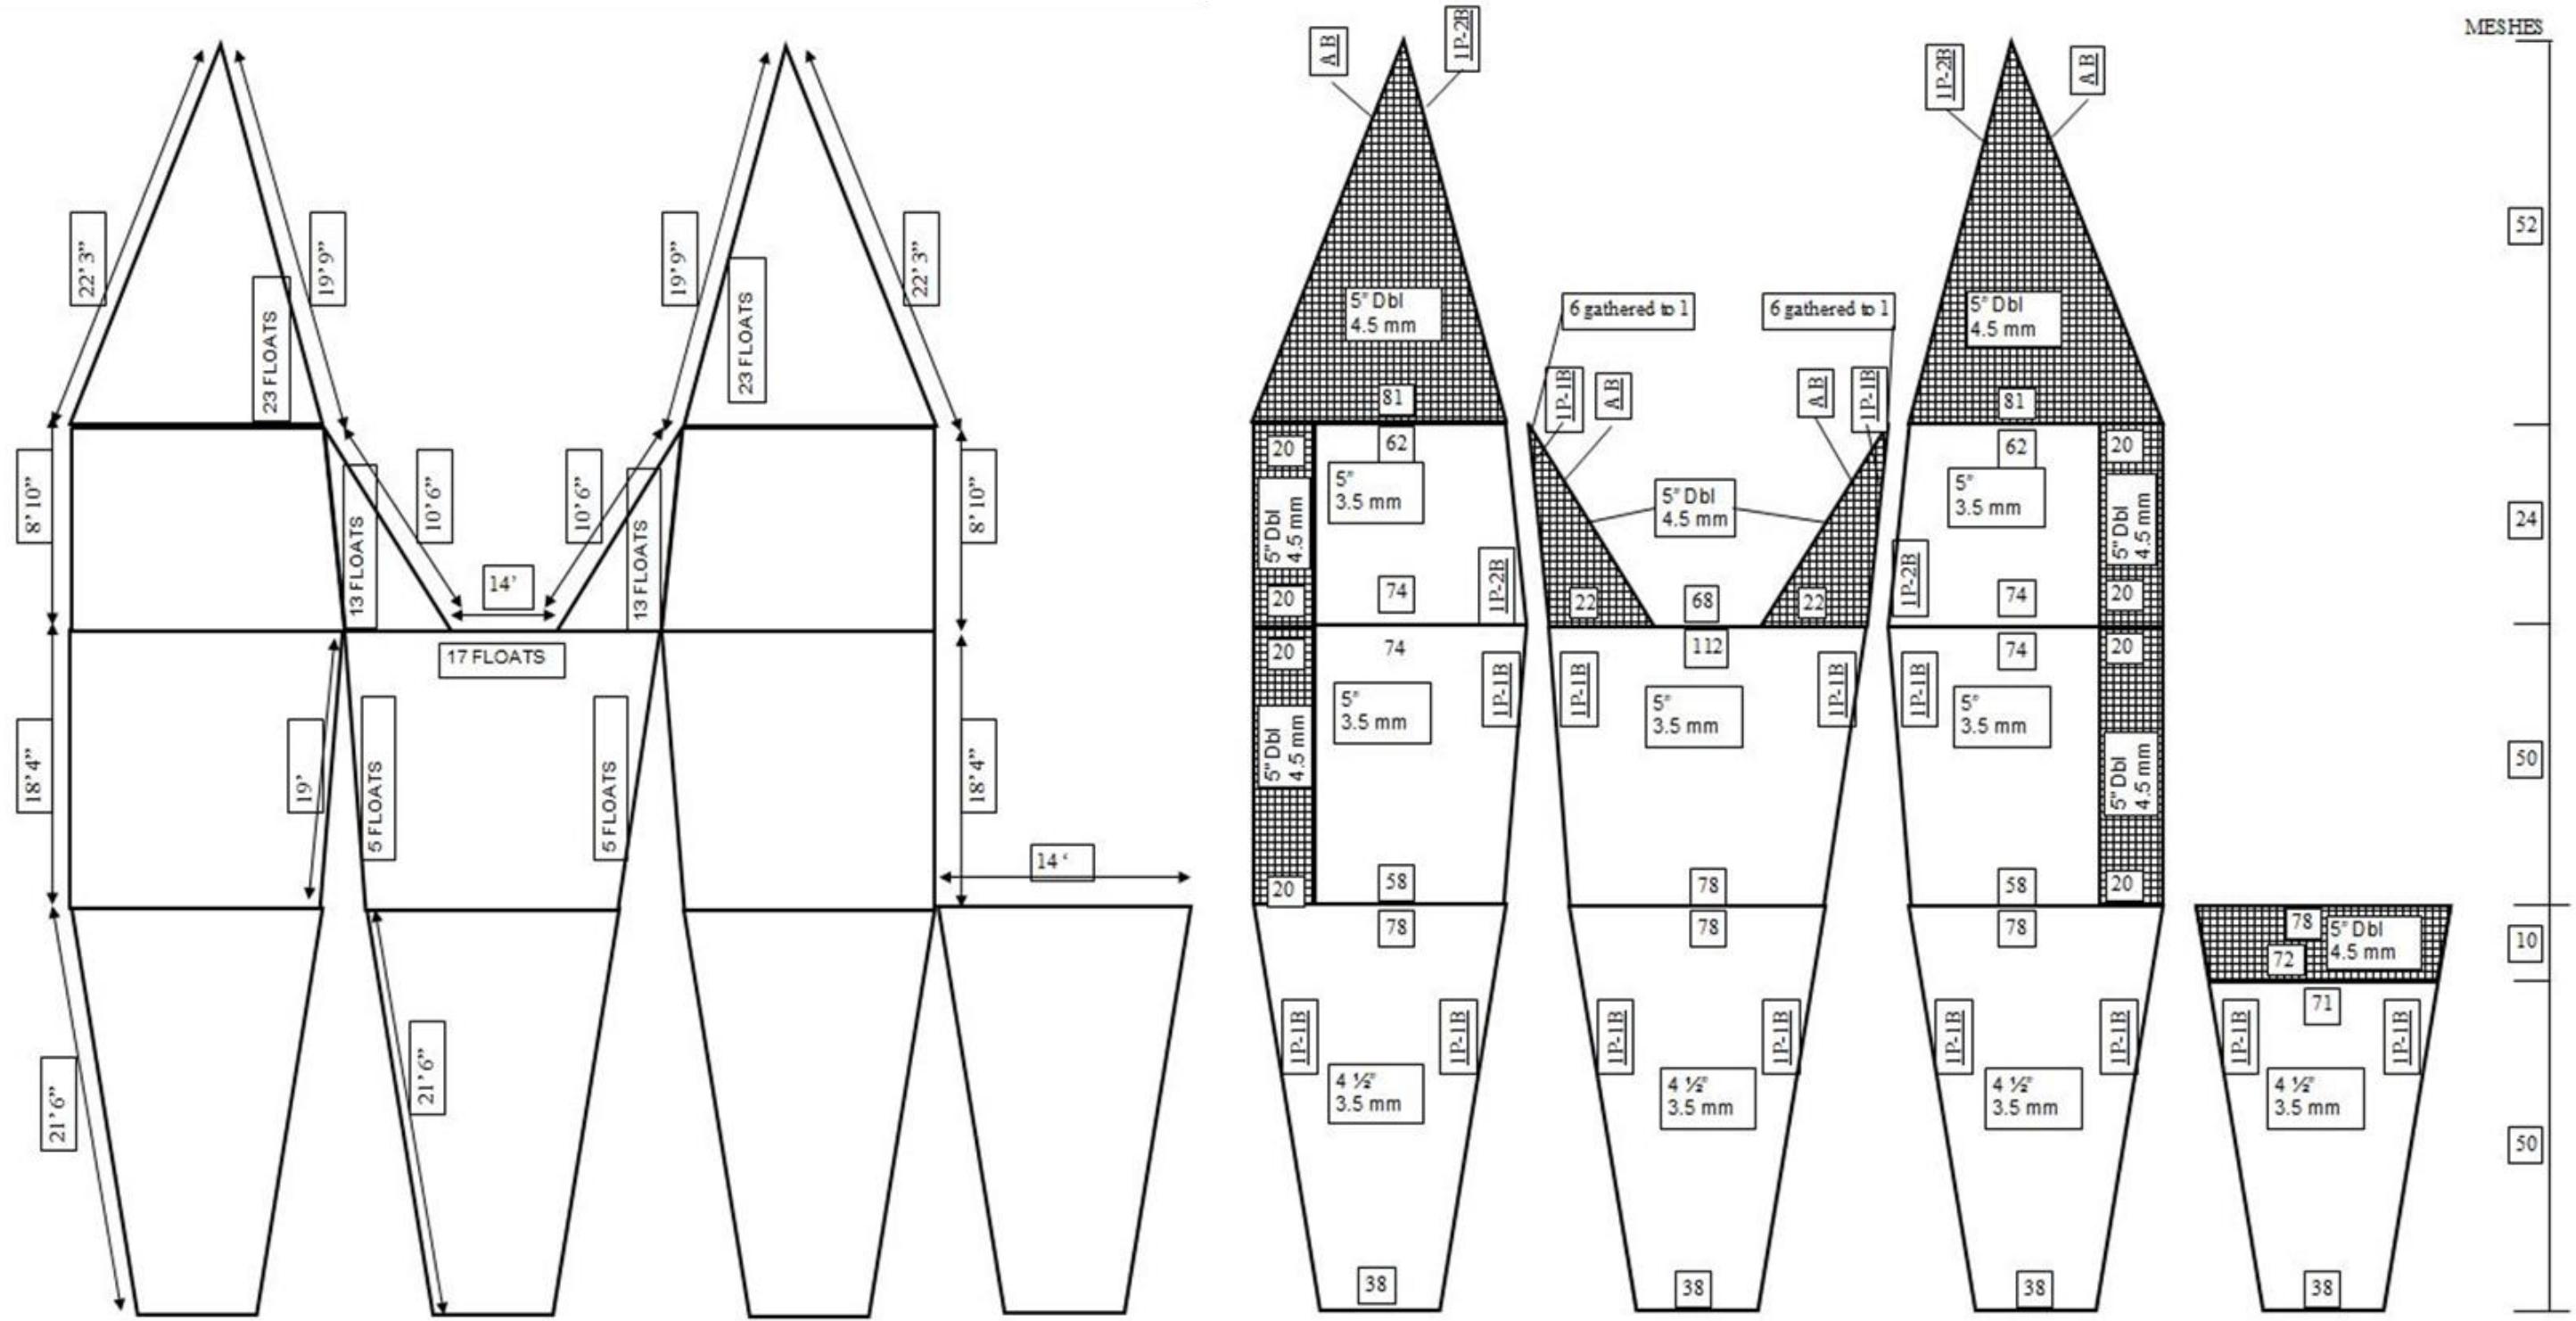

Figure 6. Details of the wing and belly sections of the Atlantic Western IIa box trawl used on the 2013 HS synoptic bottom trawl survey. Dimensions and the float arrangement are shown on the left while netting details, mesh counts, and mesh cuts are shown on the right side of the diagram.

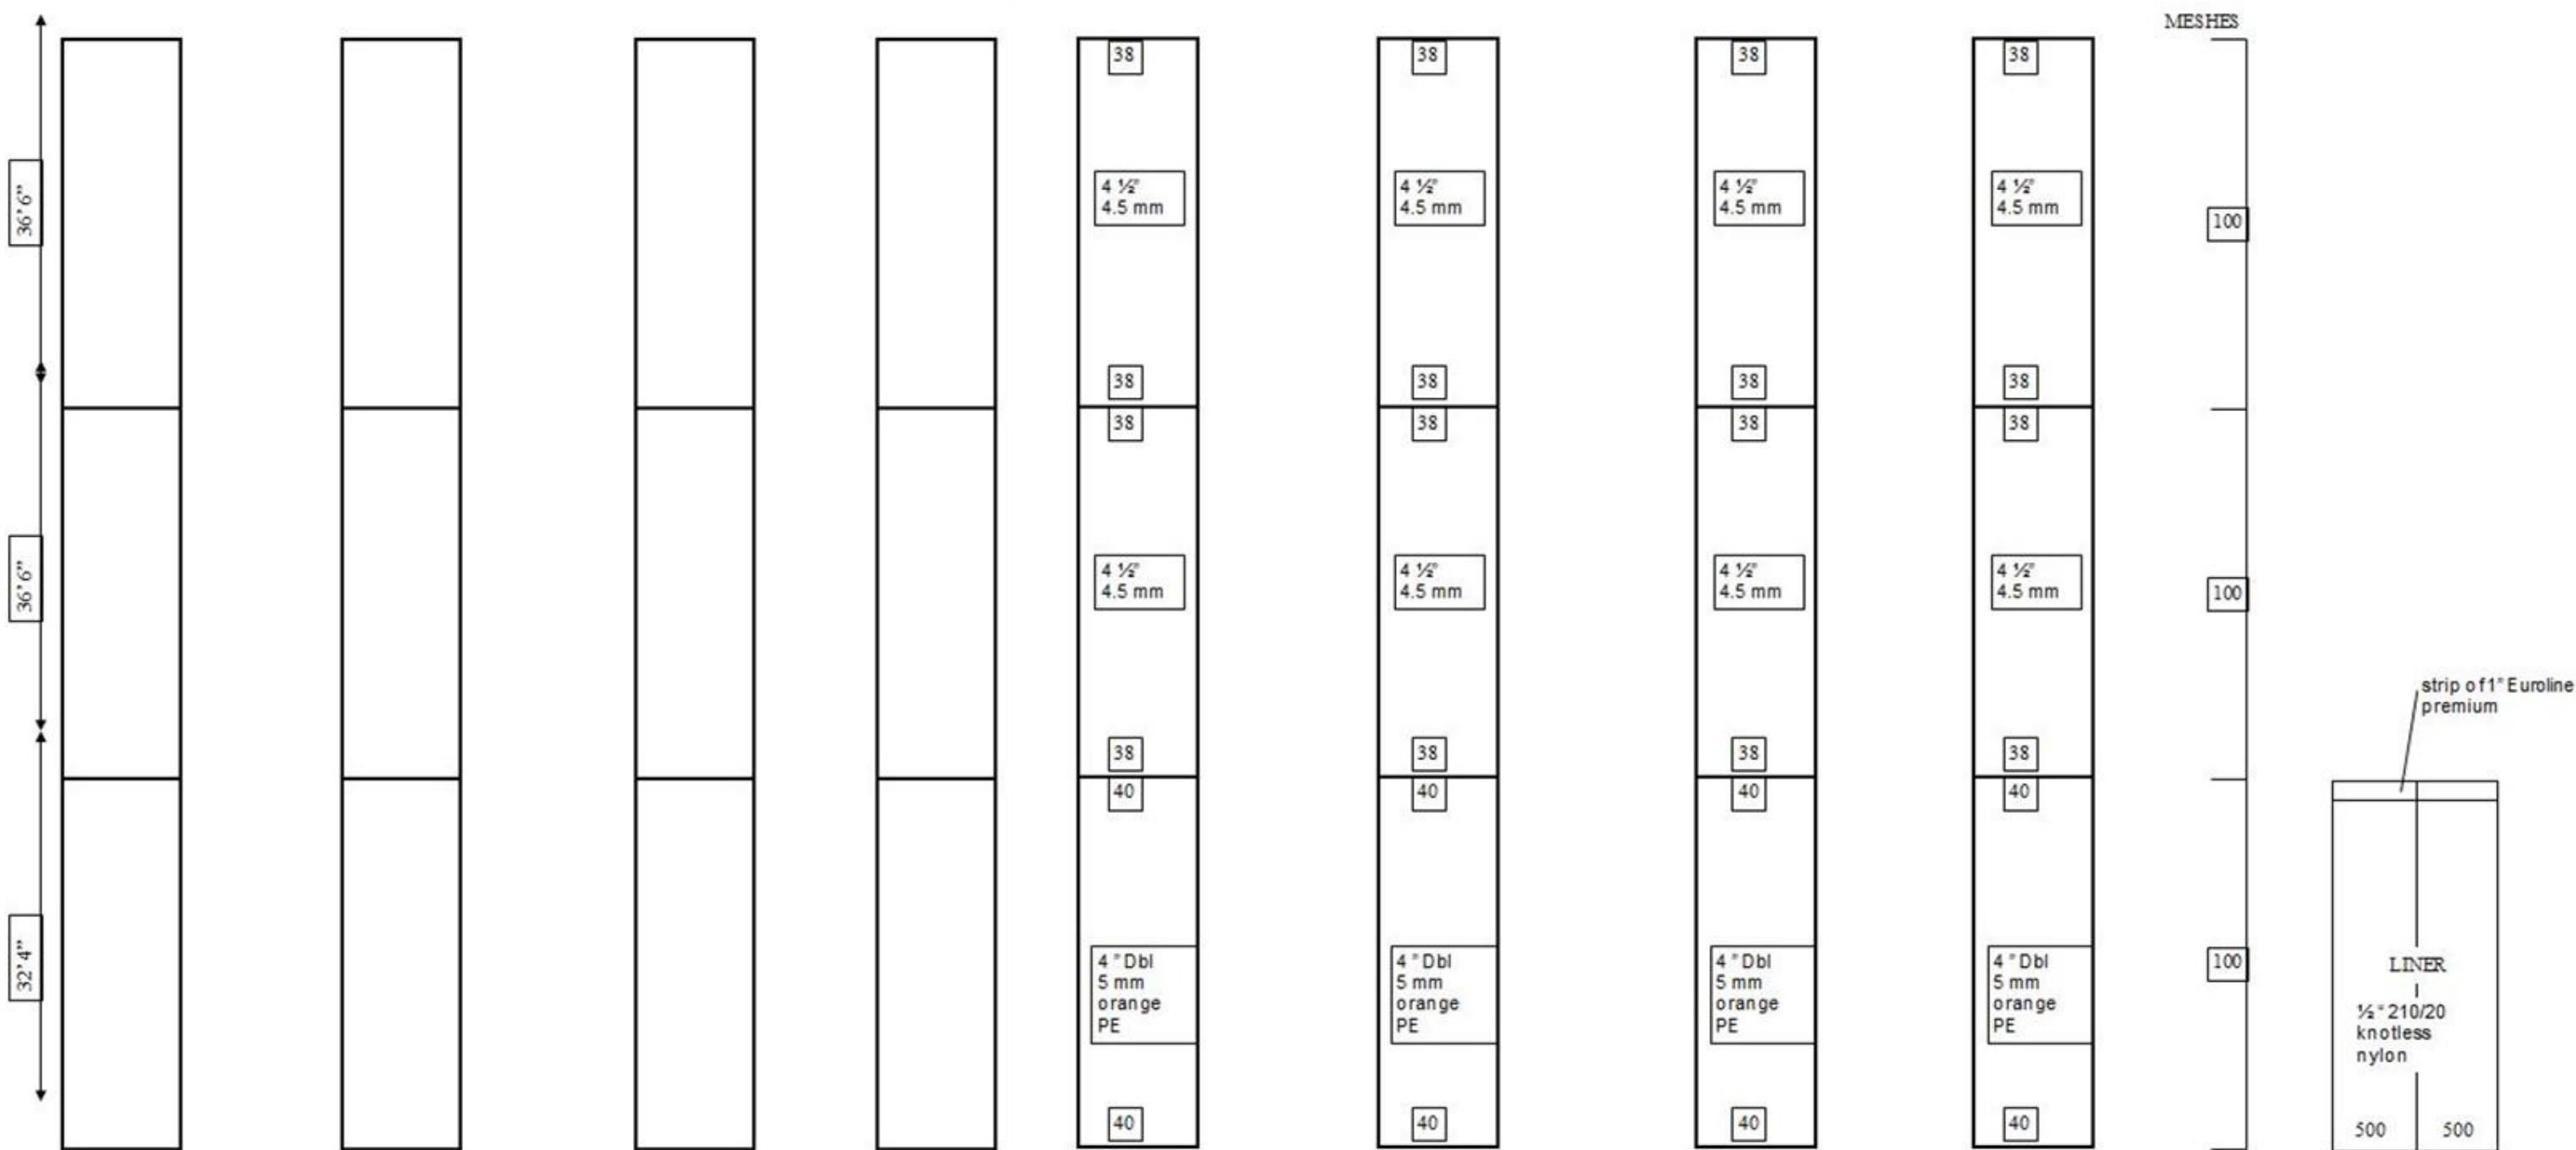

Figure 7. Details of the lengthening (intermediate) pieces and codend sections of the Atlantic Western IIa box trawl used on the 2013 HS synoptic bottom trawl survey. Dimensions are shown on the left while netting details, mesh counts, and mesh cuts including the codend liner are shown on the right side of the diagram.

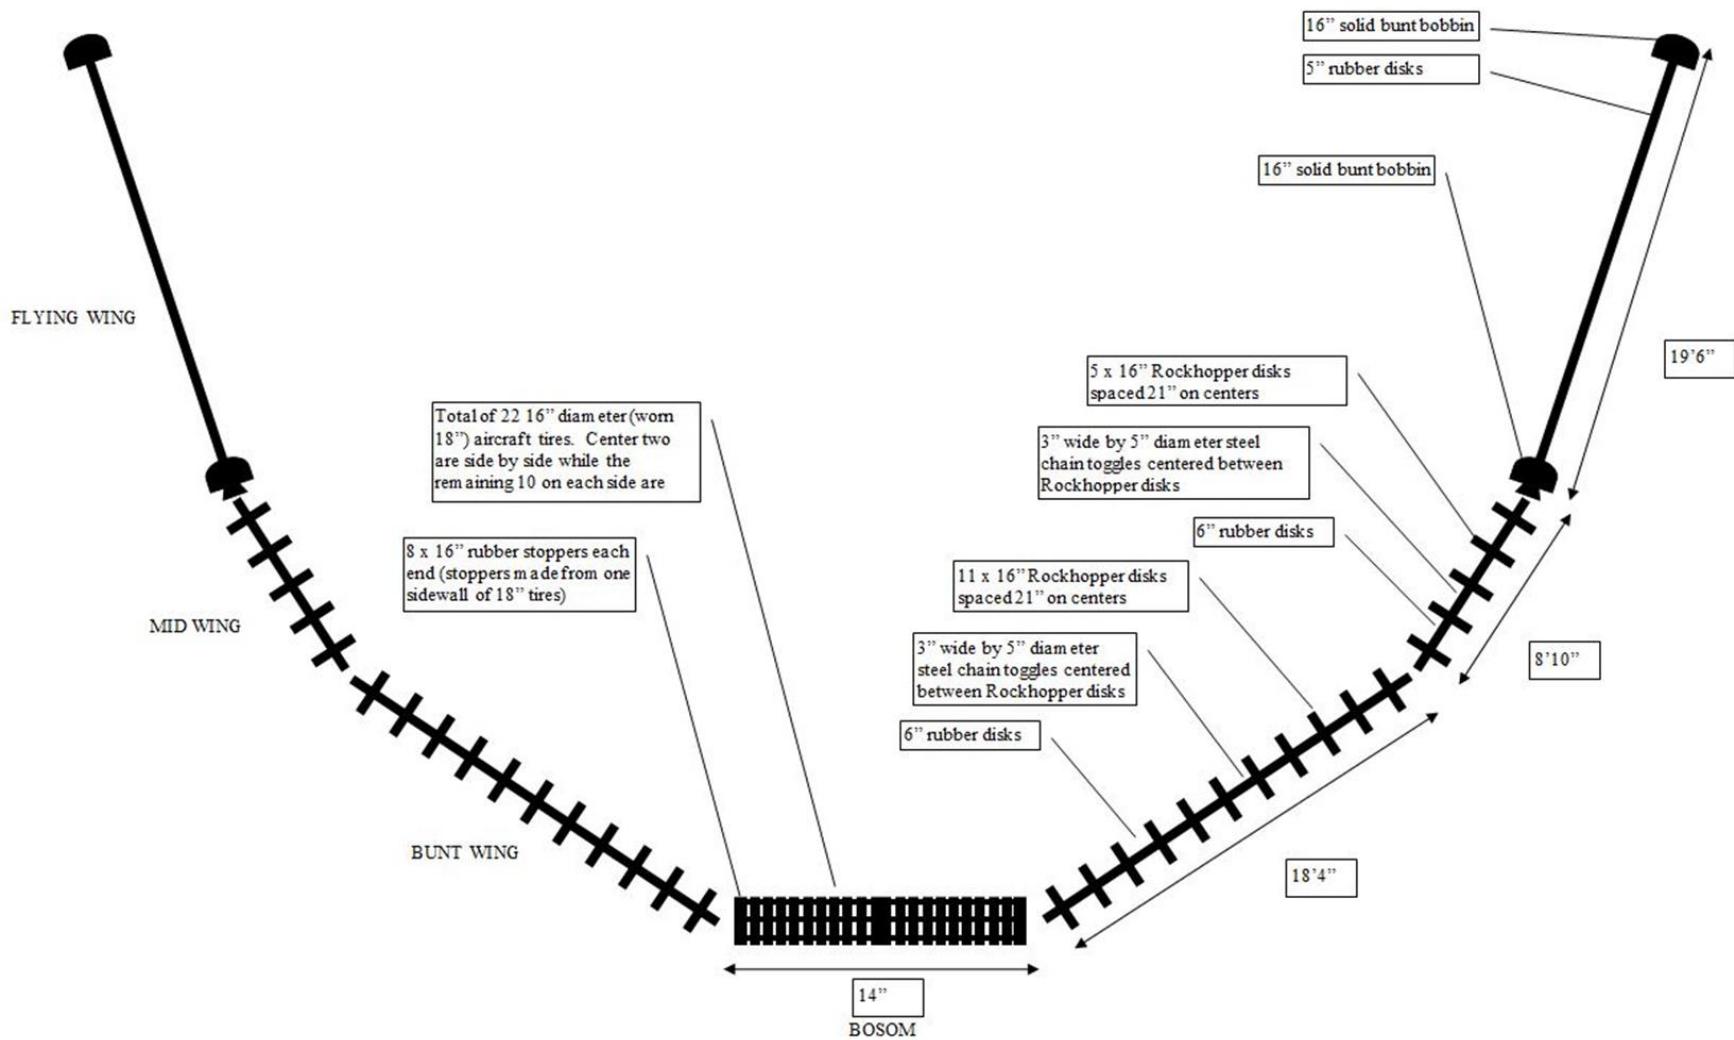

Figure 8. Details of the Rockhopper foot gear for the Atlantic Western IIa box trawl used on the 2013 HS synoptic bottom trawl survey.

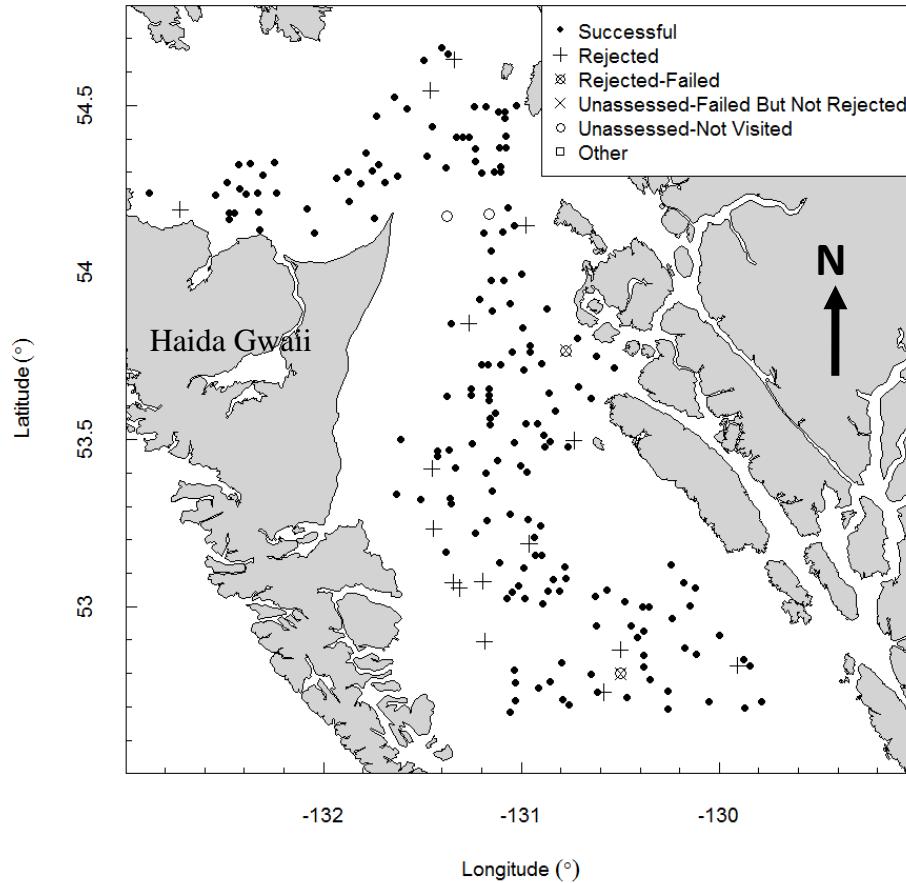

Figure 9. Final status of the 2013 HS synoptic bottom trawl survey showing 175 blocks that were fished successfully, 16 blocks rejected after inspection, two blocks rejected after multiple failed fishing attempts and two blocks unassessed.

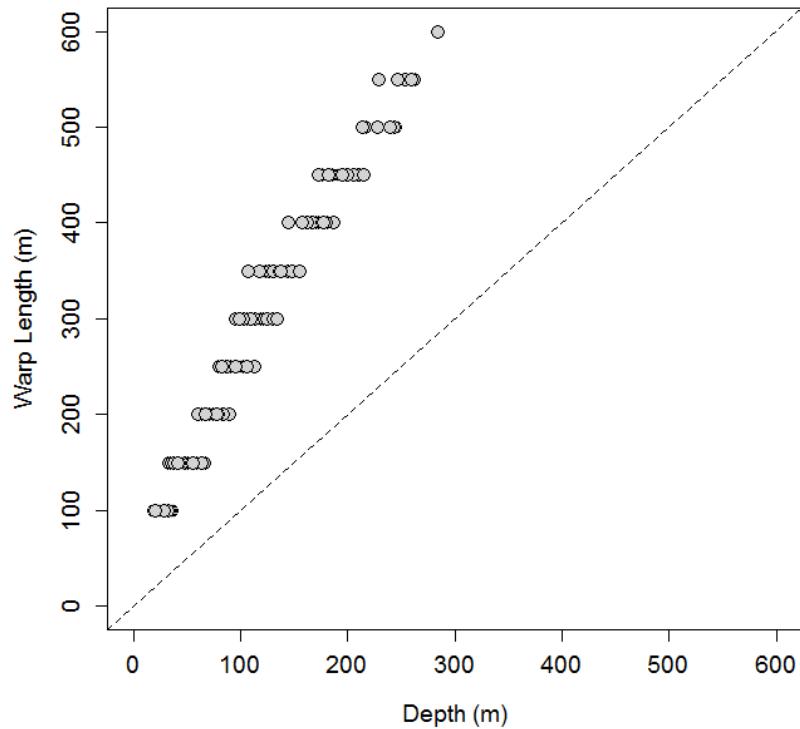

Figure 10. Warp length versus starting depth for each tow during the 2013 HS synoptic bottom trawl survey.

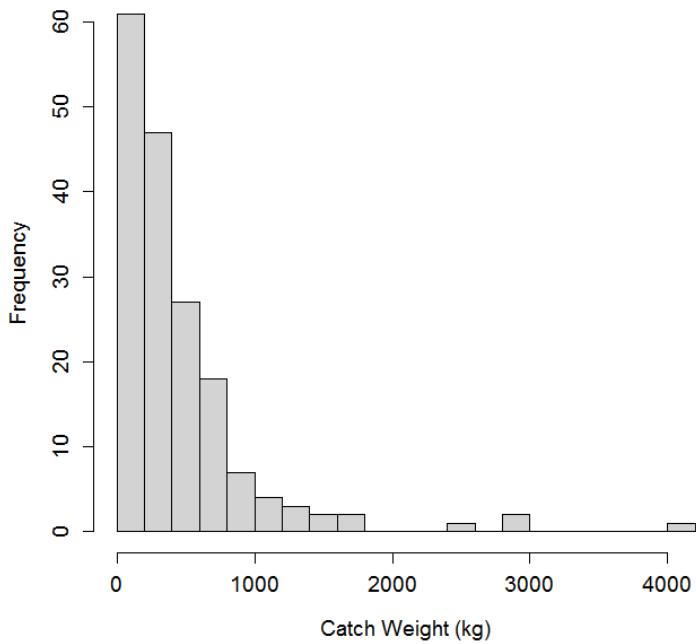

Figure 11. Histogram of catch weights caught in useable tows during the 2013 HS synoptic bottom trawl survey.

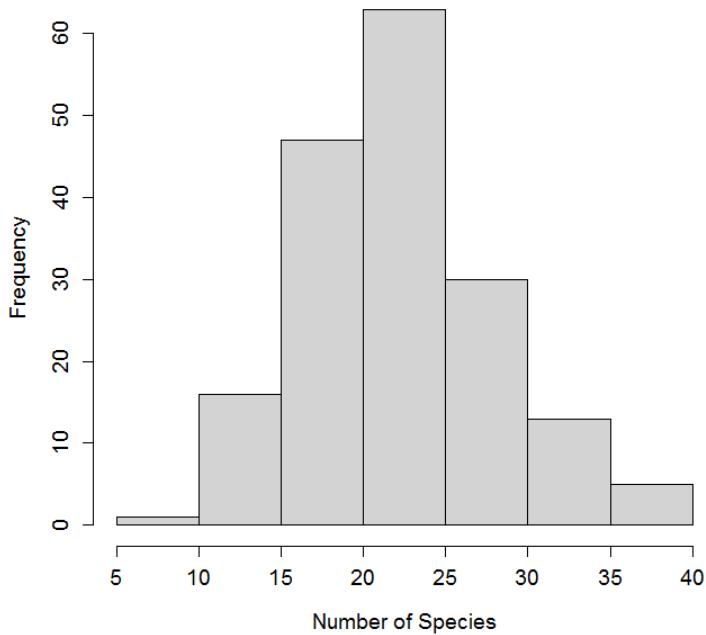

Figure 12. Histogram of number of species caught in useable tows during the 2013 HS synoptic bottom trawl survey

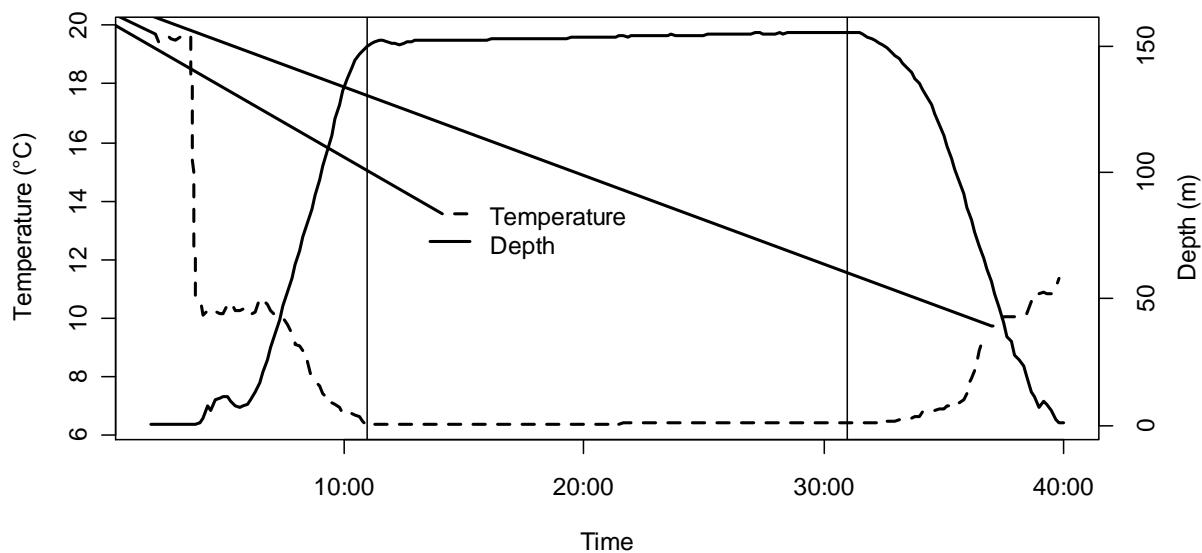

Figure 13. Example of a Seabird 39 temperature and pressure profile collected during a synoptic bottom trawl survey. The vertical lines indicate the start and end of net contact with the sea floor.

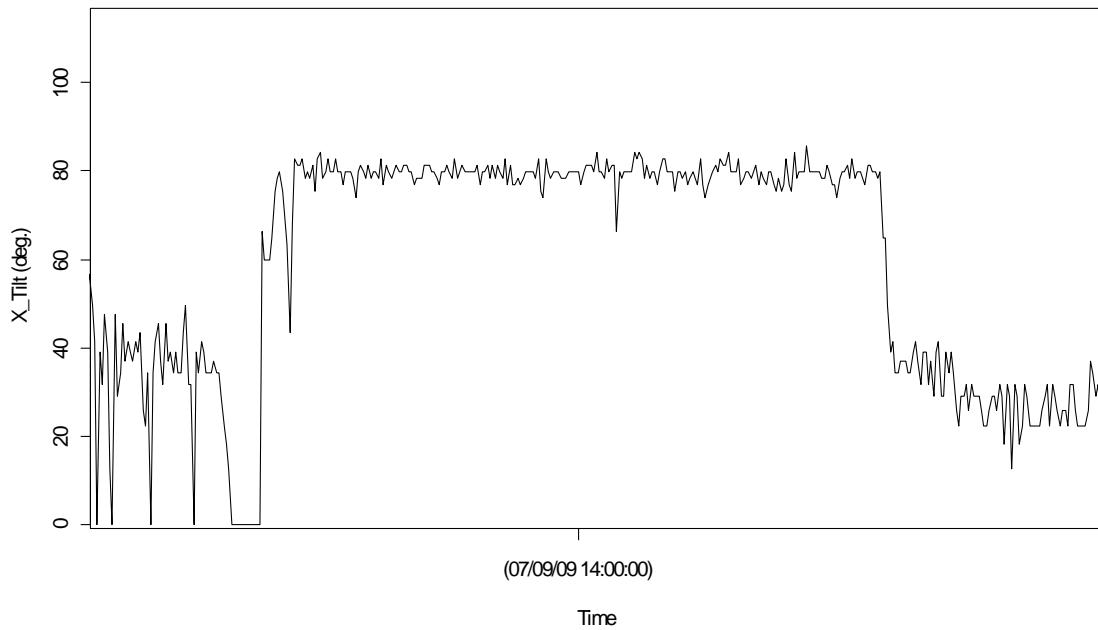

Figure 14. Example of a Mac Marine Industries bottom contact sensor profile collected during a synoptic bottom trawl survey. The raised segment in the middle of the profile at approximately 80° indicates where the net made contact with the sea floor.

Left Blank on Purpose

## APPENDIX A: HS 2013 SURVEY BRIDGE LOG

Tow	Date	Start Time	Start Latitude	Start Longitude	Average Depth (m)	Bottom Duration (min)	Speed (km/h)	Warp (m)	Catch (kg)	Useable

## APPENDIX B: CATCH BY TOW (KG). <0.1 KG ENTERED AS –

Common Name	Scientific Name	Total Weight (Kg)	1	2	3	4	5
Aleutian Skate	<i>Bathyraja aleutica</i>	14.3					
Arrowtooth Flounder	<i>Reinhardtius stomaticus</i>	19601.2	93.0			192.4	100.6
Big Skate	<i>Raja binoculata</i>	1077.6					
Bigmouth Sculpin	<i>Hemitripterus bolini</i>	33.9					7.9
Bocaccio	<i>Sebastodes paucispinis</i>	13.5					
Butter Sole	<i>Isopsetta isolepis</i>	293.0					
Canary Rockfish	<i>Sebastodes pinniger</i>	256.2					2.2
Copper Rockfish	<i>Sebastodes caurinus</i>	230.7					
Curlfin Sole	<i>Pleuronichthys decurrens</i>	125.6					
Dover Sole	<i>Microstomus pacificus</i>	6245.8	8.1			60.3	1.2
English Sole	<i>Parophrys vetulus</i>	8261.5					0.3
Eulachon	<i>Thaleichthys pacificus</i>	98.6	0.2			4.0	
Flathead Sole	<i>Hippoglossoides elassodon</i>	924.0	2.6			1.5	0.5
Giant Wrymouth	<i>Cryptacanthodes giganteus</i>	15.0					
Greenstriped Rockfish	<i>Sebastodes elongatus</i>	25.7					7.6
Kelp Greenling	<i>Hexagrammos decagrammus</i>	107.7					
Lingcod	<i>Ophiodon elongatus</i>	124.5					
Longnose Skate	<i>Raja rhina</i>	347.7	7.4			7.7	
North Pacific Spiny Dogfish	<i>Squalus suckleyi</i>	2135.1					20.7
Pacific Cod	<i>Gadus macrocephalus</i>	2641.4					9.2
Pacific Halibut	<i>Hippoglossus stenolepis</i>	3576.8					
Pacific Ocean Perch	<i>Sebastodes alutus</i>	1264.9				0.7	12.5
Pacific Sand Lance	<i>Ammodytes hexapterus</i>	263.6					
Pacific Sanddab	<i>Citharichthys sordidus</i>	450.8					
Pacific Sandfish	<i>Trichodon trichodon</i>	10.8					
Pacific Tomcod	<i>Micromesistius proximus</i>	69.2					
Petrale Sole	<i>Eopsetta jordani</i>	548.2				3.3	0.8
Quillback Rockfish	<i>Sebastodes maliger</i>	658.4					
Redbanded Rockfish	<i>Sebastodes babcocki</i>	403.5				9.4	4.7
Redstripe Rockfish	<i>Sebastodes proriger</i>	598.7					0.8
Rex Sole	<i>Glyptocephalus zachirus</i>	3997.4	2.7			1.8	36.5
Rougheye Rockfish	<i>Sebastodes aleutianus</i>	29.9	0.9				
Sablefish	<i>Anoplopoma fimbria</i>	565.7					
Sand Sole	<i>Psettichthys melanostictus</i>	757.3					
Sandpaper Skate	<i>Bathyraja interrupta</i>	18.5					
Sharpchin Rockfish	<i>Sebastodes zacentrus</i>	14.0					0.4
Shortspine Thornyhead	<i>Sebastolobus alascanus</i>	428.5				1.1	
Silvergray Rockfish	<i>Sebastodes brevispinis</i>	620.8					
Slender Sole	<i>Lyopsetta exilis</i>	52.2	0.2			1.4	0.7
Snake Prickleback	<i>Lumpenus sagitta</i>	8.8					0.0
Southern Rock Sole	<i>Lepidotrigla bilineata</i>	4056.9					
Spotted Ratfish	<i>Hydrolagus colliei</i>	15653.8	54.3			3.7	14.3
Starry Flounder	<i>Platichthys stellatus</i>	300.0					
Sturgeon Poacher	<i>Podothecus accipenserinus</i>	33.1					
Walleye Pollock	<i>Theragra chalcogramma</i>	2470.9	153.5				5.0
Widow Rockfish	<i>Sebastodes entomelas</i>	76.9					
Wolf Eel	<i>Anarrhichthys ocellatus</i>	15.7					
Yelloweye Rockfish	<i>Sebastodes ruberrimus</i>	34.8					
Yellowmouth Rockfish	<i>Sebastodes reedi</i>	55.3					2.1
Yellowtail Rockfish	<i>Sebastodes flavidus</i>	523.2					
Other		2190.9	2.3			4.1	3.2
