<sup>1</sup> This series documents the scientific basis for fisheries management advice in Atlantic Canada. As such, it addresses the issues of the day in the time frames required and the Research Documents it contains are not intended as definitive statements on the subjects addressed but rather as progress reports on ongoing investigations.

Research Documents are produced in the official language in which they are provided to the Secretariat by the author.

<sup>1</sup> Cette série documente les bases scientifiques des conseils de gestion des pêches sur la côte atlantique du Canada. Comme telle, elle couvre les problèmes actuels selon les échéanciers voulus et les Documents de recherche qu'elle contient ne doivent pas être considérés comme des énoncés finals sur les sujets traités mais plutôt comme des rapports d'étape sur les études en cours.

Les Documents de recherche sont publiés dans la langue officielle utilisée par les auteurs dans le manuscrit envoyé au secrétariat.

### Abstract

Overall commercial catches (preliminary data) of small and large salmon in the Newfoundland Region in 1989 were similar to 1988; however, catches in both years were among the lowest on record. While catches in some individual SFAs increased over 1988, they still remained below the means in nearly all cases. The catch of grilse in the recreational fishery in insular Newfoundland in 1989 was the lowest during the 1974-89 period. The catch was 11% lower than that of 1987 when drought conditions resulted in the closure of 89 rivers, most from mid-July until the end of the angling season. In 1989, low water levels and high water temperatures resulted in the closure of 58 rivers mainly for varying time periods in August. Unlike 1987, most closures in 1989 occurred after the period of peak angling. Decreased angling catches in conjunction with low counts at most fishways and counting fences indicate that river escapements in 1989 were the lowest in recent years. There is some evidence that low marine survival could have contributed to low returns of small salmon in 1989. As well it is hypothesized that drought conditions in 1987 could have been a factor in low returns in 1989 and could impact negatively in the next few years. There were no river closures in Labrador; the recreational catches of grilse and large salmon were lower than in 1988 but exceeded the means. The similarity of commercial catches of small salmon in 1988 and 1989 and lower river escapements in 1988 indicate that abundance in 1989 in insular Newfoundland was lower than in 1988. Counts of large salmon at most counting facilities in insular Newfoundland in 1989 tended to be higher overall than in 1988 while commercial catch did not change, suggesting that the abundance of this component in 1989 was higher than in 1988. For Labrador, levels of catch of small salmon in the commercial and recreational fisheries suggest that abundance in 1989 was somewhat lower than in 1988. Commercial and recreational catches of large salmon in Labrador indicate that abundance in 1989 was similar to 1988.

### Résumé

Les prises commerciales globales (données préliminaires) de saumons de petite et grande taille dans la région de Terre-Neuve en 1989 ont été semblables à celles de 1988; cependant, les prises au cours des deux années sont parmi les plus faibles jamais enregistrées. Bien que les prises dans certaines ZPS individuelles aient augmenté par rapport à 1988, elles demeurent inférieures aux moyennes dans presque tous les cas. Les prises de madeleineaux découlant de la pêche sportive dans l'île de Terre-Neuve en 1989 ont été les plus faibles de la période 1974-1989. Les prises étaient inférieures de 11 % à celles de 1987 alors que des conditions de sécheresse avaient entraîné la fermeture de 89 rivières, la plupart de la mi-juillet jusqu'à la fin de la saison de la pêche sportive. En 1989, un faible niveau des eaux et des températures de l'eau élevées ont entraîné la fermeture de 58 rivières, surtout pour des périodes de temps variables en août. Contrairement à 1987, la plupart des fermetures enregistrées en 1989 sont survenues après la haute saison de pêche sportive. Une diminution des prises de la pêche sportive combinée à des résultats faibles concernant le dénombrement des poissons dans la plupart des passes et des clôtures indiquent que la remonte en 1989 était la plus faible des dernières années. Certaines indications montrent qu'une faible survie en mer pourraient avoir contribué à un faible retour du petit saumon en 1989. De plus, on émet l'hypothèse que les conditions de sécheresse qui ont régné en 1987 pourraient elles aussi avoir contribué au faible retour en 1989 et qu'elles pourraient continuer à avoir des répercussions négatives au cours des prochaines années. Il n'y a pas eu de fermeture de rivières au Labrador; les prises de la pêche sportive en madeleineaux et en saumons de grande taille ont été plus faibles qu'en 1988, mais supérieures aux moyennes. La ressemblance entre les prises commerciales de petits saumons en 1988 et 1989 et les faibles remontes en 1988 indiquent qu'en 1989, l'abondance du saumon dans l'île de Terre-Neuve était plus faible qu'en 1988. Les dénombremens de saumons de grande taille dans la plupart des installations de dénombrement de l'île de Terre-Neuve avaient tendance à être globalement plus élevés en 1989 qu'en 1988, tandis que les prises commerciales n'ont pas changé, ce qui laisse entendre que l'abondance de cette composante était plus élevée en 1989 qu'en 1988. Pour le Labrador, les taux de prise de saumons de petite taille par suite de la pêche sportive et commerciale indiqueraien que l'abondance était légèrement plus faible en 1989 qu'en 1988. Les prises commerciales et sportives de saumons de grande taille au Labrador indiquent que l'abondance était semblable en 1988 et en 1989.

## Introduction

This paper presents the status of Atlantic salmon stocks of the Newfoundland Region (Fig. 1) in 1989. Catch and effort data for the commercial and recreational fisheries and fishway counts (insular Newfoundland) are examined in relation to historical data and the 1989 Management Plan.

Management measures in effect in the commercial fishery in 1989 were the same as for 1988 with the exception that 'allowance catches' were introduced for each Salmon Fishing Area (SFA) in 1989. The fishing season started June 5 and ended October 15. It was illegal to retain Atlantic salmon caught as by-catch and the mandatory carcass tagging program remained in effect. The number of licensed fishermen and the amount of licensed gear in the commercial fishery in 1989 are shown in Tables 1 and 2 respectively. The numbers of commercial fishermen and gear units in Labrador in 1989 increased slightly over 1988. In insular Newfoundland, numbers of fishermen and gear units showed a slight decrease.

For the recreational fishery, regulations in 1989 were the same as in 1988. There was a mandatory release of large salmon in insular Newfoundland; however, this regulation did not apply to Labrador. The maximum number of fish that could be retained per day was two and the maximum number that could be hooked and released was four. Angling ceased for the day when one or the other limit was attained. The mandatory carcass tagging program remained in effect as did the season bag limit of 15 fish.

The 1989 recreational fishing season was marked by the closure of a large number of rivers to angling as a result of low water levels and high water temperatures. These closures occurred mainly in the month of August. The rivers involved and the duration of closure for each river are shown in Table 3.

## Methods

Commercial and recreational fishery catch and effort data and fishway and counting fence data were added to that presented in O'Connell et al. (1989). Commercial catch data for 1989 were preliminary. Effort in the commercial fishery was presented as the number of gear units (91.5 m of gill net or salmon trap) licensed to prosecute the fishery. Recreational fishing effort was presented as rod days (defined as any day or part thereof on which an angler fishes).

Data collection, the calculation of mean weights of small and large salmon in the commercial fishery, the breaking down of unsized catch into the small and large categories, and the estimation of numbers of small and large salmon followed procedures outlined in Ash and O'Connell (1987a, 1987b).

Means and 95% confidence intervals for ratio variables were calculated according to Cochran (1977).

## Results

### **Insular Newfoundland**

Commercial fishery: The commercial catch of small salmon (259 t) in the insular Newfoundland portion of the Newfoundland Region in 1989 (Table 4) was similar to 1988 (increased by 6%) but decreased from the 1974-88 (27%) and 1984-88 (22%) means (Table 5). The catch of large salmon (189 t) in 1989 was the same as in 1988 but decreased from the 1974-88 (52%) and 1984-88 (28%) means. Total catch was similar to 1988 (+3%) but was 40 and 25% below the 1974-88 and 1984-88 means respectively. Additional information, namely catch in terms of number and percent small (by weight and by number), is presented in Appendix 1a.

Recreational fishery: The catch of grilse (11,525) in 1989 (Table 4 and appendix 2a) was down 52% from 1988 and decreased by 46% from the 1974-88 mean and by 49% from the 1984-88 mean (Table 5). The 1989 catch was 11% lower than in 1987 in which year drought conditions resulted in the closure of 89 rivers, most from mid-July until the end of the angling season. In 1989, 58 rivers were closed because of low water levels and high water temperatures; however, the closures were mainly in August for varying periods of time (Table 3).

Effort expenditure in 1989 (Table 4 and Appendix 2a) was below 1989 (27%) and the 1974-88 (23%) and 1984-88 (26%) means (Table 5) as was catch per unit of effort (CPUE) (36, 32, and 32% respectively).

### **Labrador**

Commercial fishery: The commercial catch of small salmon (107 t) in the Labrador portion of the Newfoundland Region in 1989 (Table 4 and Appendix 1b) was below 1988 (26%) and the 1974-88 mean (14%) but similar to the 1984-88 mean (-3%) (Table 5). The catch of large salmon (222 t) was similar to 1988 (+5%) and the 1984-88 mean (-1%) but below the 1974-88 mean (38%). Total commercial catch followed a similar pattern as that of large salmon.

Recreational fishery: There were no river closures in Labrador in 1989. The catch of grilse (3,511) in 1989 (Table 4 and Appendix 2b) decreased by 10% from 1988 but increased by 25% over each of the means (Table 5). The catch of large salmon (408) decreased by 11% from 1988, was similar to the 1974-88 mean (-4%), and increased over the 1984-88 mean (21%).

Effort expenditure in 1989 (Table 4 and Appendix 2b) was similar to 1988 (-4%) but increased over the 1974-88 (39%) and 1984-88 (26%) means (Table 5). CPUE was similar to 1988 (-5%) and the 1984-88 mean (+2%) but declined from the 1974-88 mean (-12%).

### **Newfoundland Region**

Commercial fishery: The total catch of small salmon for the entire Newfoundland Region in 1989 (Table 4 and Appendix 1c) was similar to 1988 (-6%) but lower than the 1974-88 (23%) and 1984-88 (17%) means (Table 5). The total catch of large salmon was also similar to 1988 (+2%) but decreased by 46% from the

1974-88 mean and by 15% from the 1984-88 mean. Total catch (small and large salmon combined) was similar to 1988 (-2%), 37% below the 1974-88 mean, and 16% below the 1984-88 mean.

Recreational fishery: The total catch of grilse for the entire Newfoundland Region in 1989 (Table 4 and Appendix 2c) was below 1988 (46%) and the 1974-88 (38%) and 1984-88 (41%) means (Table 5). Because of regulations governing the retention of large salmon, comparisons for this component in terms of the entire Newfoundland Region are of no pertinent value; the same applies to total recreational catch.

### **Status by Salmon Fishing Area**

Commercial catch data for each SFA of the Newfoundland Region are presented in Table 6 and Appendices 1d-n. Recreational catch and effort data are shown in Table 6 and Appendices 2d-n. Table 5 shows commercial and recreational catches and recreational effort and CPUE for each SFA, expressed as percentages in relation to 1988, the 1974-88 mean and the 1984-88 mean.

#### **Labrador**

SFA 1: The commercial catch of small salmon in 1989 increased over 1988 and both means. The catch of large salmon increased over 1988 and the 1984-88 mean and was similar to the 1974-88 mean.

In the recreational fishery the catch of grilse was similar to 1988 but below the two means. The catch of large salmon was below 1988 and both means. Effort was below 1988, above the 1974-88 mean, and similar to the 1984-88 mean. CPUE increased over 1988, decreased from the 1974-88 mean, and was similar to the 1984-88 mean.

SFA 2: The commercial catches of small and large salmon in 1989 decreased from 1988 and both means.

The recreational catch of grilse in 1989 decreased from 1988 and the means. The catch of large salmon was similar to 1988 but above the means. Effort was similar to 1988 and above both means. CPUE decreased from 1988 and the 1974-88 mean and was similar to the 1984-88 mean.

#### **Insular Newfoundland**

SFA 3: Commercial catches of small and large salmon decreased from 1988 and the two means.

Recreational catches of grilse, effort, and CPUE all decreased from 1988 and the means.

SFA 4: The commercial catch of small salmon increased over 1988 and was similar to the means. The commercial catch of large salmon increased over 1988 but was below the means.

In the recreational fishery, the catch of grilse was below 1988 and both means, as was effort and CPUE.

Counts of grilse and large salmon at fishways located in Exploits River and Salmon Brook (Gander River), and a counting fence installed just above head of tide in the main stem of Gander River for the first time in 1989, are presented in Tables 7 and 8 respectively. Table 9 shows counts in 1989 expressed as percentages in relation to 1988 and the 1979-88 and 1984-88 means. For the Exploits River, counts of grilse in 1989 decreased from 1988 and the means at both the Bishop's Falls and Great Rattling Brook fishways. The same was true for Salmon Brook. Large salmon counts decreased from 1988 and both means at Bishop's Falls, increased over 1988 but decreased from the means at Great Rattling Brook, and was similar to 1988 and increased over the means at Salmon Brook. The count of grilse at the counting fence in Gander River in 1989 was 7,685 and as well 451 large salmon were counted.

SFA 5: The commercial catch of small salmon in 1989 was similar to 1988 but decreased from the means. The catch of large salmon was below 1988 and both means.

The catch of grilse in the recreational fishery in 1989, effort, and CPUE were all below 1988 and the means.

Fishways in SFA 5 are located in Middle Brook and Terra Nova River (upper and lower). The count of grilse in Middle Brook in 1989 (Table 7) was below 1988 and both means (Table 9). The grilse count at the lower Terra Nova River fishway in 1989 decreased from 1988 (the highest count on record), was similar to the 1974-88 mean, and increased over the 1984-88 mean. The count of large salmon in Middle Brook in 1989 (Table 8) increased over 1988 but was below the means. The count of large salmon at the lower Terra Nova River fishway decreased from 1988 and increased over the means.

SFA 6: The commercial catch of small salmon in 1989 increased over 1988 but decreased form the means. The catch of large salmon was the same as in 1988 but lower than the means.

The catch of grilse in the recreational fishery in 1989 was below 1988 and the means. Effort was below 1988 but higher than the means while CPUE decreased from 1988 and both means.

SFA 7: The catch of small salmon in the commercial fishery in 1989 was the same as in 1988 but below the means. The catch of large salmon was below 1988 and both means.

The recreational catch of grilse in 1989 decreased from 1988 and the means. Effort was lower than for 1988 and the 1974-88 mean and was similar to the 1984-88 mean. CPUE was below 1988 and the means.

SFA 8: Catches of small and large salmon in the commercial fishery in 1989 were below 1988 and the means.

The catch of grilse in the recreational fishery in 1989 increased over 1988 and both means. The reverse was true for effort. CPUE increased over 1988 and the means.

SFA 9: The commercial catch of small salmon in 1989 was the same as in 1988 but below the means. The catch of large salmon decreased from 1988 and the 1974-88 mean and was similar to the 1984-88 mean.

In the recreational fishery, the catch of grilse in 1989 was similar to 1988 but below the means. Effort decreased from 1988 and the means while CPUE was the same as in 1988 but below the means.

A number of counting fences (Biscay Bay River, Northeast Brook, Trepassey, and Colinet River) and a fishway (Rocky River) have been operated in SFA 9 over the years. The count of grilse in Biscay Bay River and Northeast Brook, Trepassey in 1989 (Table 7) decreased from 1988 and the 1984-88 mean (Table 9). The count of grilse in Colinet River increased over 1988 and the mean, possibly the result of enhancement measures on that river in recent years. The count of large salmon in Biscay Bay River in 1989 (Table 8) increased over 1988 and the mean (Table 9). In Northeast Brook, Trepassey, the count of large salmon was similar to 1988 but below the mean. In Colinet River, the number of large salmon increased over 1988 and the mean. For the Rocky River fishway, the count of grilse in 1989 was lower than in 1988 with the reverse true for large salmon.

It should be noted that the counting fence in Biscay Bay River was washed out for a period of 39 hours beginning July 8, 1989; an estimated 100 fish (grilse and large salmon combined) escaped upstream during this period.

SFA 10: In 1989, the commercial catch of small salmon increased over 1988 and the means. The catch of large salmon exceeded 1988 and the 1984-88 mean but was below the 1974-88 mean.

The catch of grilse in the recreational fishery in 1989 as well as effort and CPUE were below 1988 and the means.

The count of grilse at the Northeast River, Placentia fishway in 1989 (Table 7) exceeded 1988 and the means (Table 9). Large salmon in 1989 (Table 8) increased over 1988 but decreased from the means (Table 9).

SFA 11: Commercial catches of small and large salmon in 1989 increased over 1988 but decreased from the means.

The recreational catch of grilse in 1989 was below 1988 and the means. Effort decreased from 1988 and the 1984-88 mean and was similar to the 1974-88 mean. CPUE decreased from 1988 and the means.

The count of grilse at the Conne River counting fence in 1989 (Table 7) decreased from 1988 and the mean (Table 9). The count of grilse at the Grand Bank fishway increased over 1988 but was similar to the mean. Large salmon in 1989 (Table 8) increased over 1988 and the mean in Grand Bank Brook while the reverse was true for Conne River (Table 9).

### Discussion

Except for the introduction of 'allowance catches' the Management Plan in 1989 was a continuation of a five year Management Plan introduced in 1984 and variously modified over the period 1984-88. Major changes in the fisheries were put into effect under this plan. An analysis of the impacts of these management measures in terms of commercial catches and river escapements in the Newfoundland Region is provided by O'Connell et al. (1990). In the context of the 1984-88 Management Plan, the most pertinent comparisons of commercial and recreational catches and counts at counting facilities in 1989 is with the 1984-88 mean.

Except for the lower catch of small salmon in Labrador, overall commercial catches of small and large salmon in the Newfoundland Region in 1989 were similar to 1988; however, catches in both years were among the lowest on record. While catches in some SFAs increased over 1988, they still remained below the means in nearly all cases.

A comparison of 'allowance catches' with actual catches (in tonnes) for each SFA is as follows:

<u>SFA</u>	<u>Allowance</u>	<u>Actual</u>
1	80	107
2	350	223
3	270	152
4	170	130
5	55	36
6	45	27
7	25	13
8	25	11
9	10	7
10	35	38
11	50	34
Total	1,115	778

Actual catches exceeded 'allowance catches' only in SFAs 1 and 10. Total actual catch was 30% below total 'allowance catch'.

The catch of grilse in the recreational fishery in insular Newfoundland in 1989 was the lowest during the 1974-89 period. The catch was 11% lower than that of 1987 when drought conditions resulted in the closure of 89 rivers to angling; in the majority of cases in 1987 the closure period was from mid-July until the end of the angling season (September 7). In 1989, 58 rivers were closed to angling due to low water levels and high water temperatures with most closures occurring for varying periods of time in August. The closures in 1989 came after the period of peak angling catches which normally occur in July-early August in most rivers in insular Newfoundland. Decreased angling catches, generally unaffected by river closures, in conjunction with low counts at most fishways and counting fences indicate that river escapements in 1989 were the

lowest in recent years. Also, the grilse catch for 1987 was included in the calculation of the mean for 1984-88 which further underscores the low 1989 catches. Unlike 1987, water levels (Figs. 2-9) and temperatures (Figs. 9-17) in 1989 were such that fish could pass through all counting facilities prior to termination of counting in standardized week 36 (September 3-9).

In insular Newfoundland, the similarity of commercial catches of small salmon in 1988 and 1989 and lower river escapements in 1988 indicate that the abundance in 1989 was lower than in 1988. The implication is that the rate of exploitation in the commercial fishery was higher in 1989 than in 1988. Counts of large salmon at most counting facilities in 1989 tended to be higher overall than in 1988 while the overall commercial catch did not change, suggesting the abundance of this component in 1989 was higher than in 1988. For Labrador, levels of catch of small salmon in the commercial and recreational fisheries suggest that abundance in 1989 was somewhat lower than in 1988. Commercial and recreational catches of large salmon suggest that the abundance of this component in 1989 was similar to 1988.

Based on both average 1984 angling catches of grilse (used as an index of spawning escapement) and fishway counts, a modal smolt age of 3+ years, and the possible existence of an undefined stock-recruitment relationship, 1989 commercial catches and river escapements of small salmon in insular Newfoundland should have been average. A lower marine survival could have contributed to low returns in 1989. Survival of smolts (back to the river) in 1989 for Conne River in SFA 11 (Dempson 1989) and Northeast Brook, Trepassey in SFA 9 (O'Connell, unpublished data) was lower than for the previous two years. Also, return rates of smolts tagged with streamer tags in Conne River (Dempson 1989) and Carlin tagged smolts in Exploits River in SFA 4 (Bourgeois, unpublished data) were lower in 1989 than in 1988.

It is hypothesized that adverse environmental conditions (low water levels and high water temperatures) in rivers in 1987 could have contributed to low returns in 1989 and could impact negatively in the next few years.

**Table 3.** Periods of closure due to drought conditions for scheduled rivers in Newfoundland Region (Insular), 1989.

<u>River Name</u>	<u>Period Closed</u>
<b>SFA 3</b>	
Western Brook, Hare Bay	Aug. 5 - Aug. 17
Salmon River, Ariege Bay	Aug. 5 - Aug. 17
Easter Brook, Canada Bay	July 15 - Sept. 4
Northeast Brook, Chimney Bay	July 29 - Aug. 17
Beaver Brook (Western Brook)	July 29 - Aug. 17
Northwest Brook, Canada Bay	July 29 - Aug. 17
Little Harbour Deep River	July 29 - Aug. 17
Coney Arm River	July 15 - Aug. 17
Main River, Sops Arm	July 22 - Aug. 17
Wild Cove Brook, White Bay	July 29 - Sept. 4
Western Arm Brook	July 29 - Sept. 4
Middle Arm Brook	July 29 - Sept. 4
Southern Arm Brook	July 29 - Sept. 4
Southwest Brook, Baie Verte	July 15 - Sept. 4
<b>SFA 4</b>	
East Brook, Burlington River	July 29 - Sept. 4
Indian River	July 29 - Aug. 17
Riverhead Brook, West Brook	July 29 - Aug. 17
South Brook, Halls Bay	July 29 - Aug. 17
Tommy's Arm River	July 29 - Aug. 17
Northwest Arm Brook	July 15 - Aug. 25
West Arm Brook, Western Arm	July 15 - July 28
New Bay River, Point Leamington	Aug. 10 - Aug. 25
Charles Brook	July 15 - Aug. 25
Northern Arm Brook	July 15 - Aug. 17
Peters River	July 15 - Aug. 25
Exploits River (Gt. Rattling Brook) (Stoney Brook)	July 15 - Aug. 25
Indian Arm Brook (Campbellton)	July 15 - Aug. 25
Dog Bay River, Horwood River	Aug. 10 - Aug. 25
Gander River (Northwest) (Southwest) (Soulis Brook)	July 15 - July 18 July 15 - July 18 July 15 - July 18
Ragged Harbour River	Aug. 10 - Aug. 25
Anchor Brook	Aug. 10 - Aug. 25
Deadman's Brook	Aug. 10 - Aug. 25
Windmill Brook	Aug. 10 - Aug. 25

**Table 3 Cont'd.****SFA 5**

Indian Bay Brook	Aug. 5 - Sept. 4
Northwest River (Trinity)	Aug. 5 - Sept. 4
Traverse Brook	Aug. 5 - Sept. 4
Middle Brook	Aug. 5 - Sept. 4
Gambo River	Aug. 5 - Aug. 17
Northwest Brook, Alexander Bay	Aug. 5 - Aug. 17
Terra Nova River (Maccles Brook)	Aug. 5 - Aug. 17
Northwest River, Port Blandford	Aug. 10 - Aug. 17
Salmon Brook, Port Blandford	Aug. 10 - Aug. 17
Southwest Brook, Port Blandford	Aug. 10 - Aug. 17

**SFA 9**

Branch River	Aug 10 - Aug 17
--------------	-----------------

**SFA 10**

Northeast River, Placentia	Aug. 10 - Aug. 27
Pipers Hole River	Aug. 10 - Aug. 17
Salmonier River, Lamaline	Aug. 10 - Aug. 17

**SFA 11**

Grand Bank River	Aug. 10 - Aug. 17	
Garnish River	Aug. 10 - Aug. 17	
Long Harbour River	Aug. 10 - Aug. 17	
Conne River	July 8 - July 14	
Grey River	July 8 - July 11	July 29 - Aug. 17
White Bear River	July 8 - July 14	July 29 - Aug. 17
Grandy's River	July 8 - July 14	July 29 - Aug. 17
Cinq Cerf Brook	July 8 - July 14	July 29 - Sept. 4
