<sup>1</sup> This series documents the scientific basis for fisheries management advice in Atlantic Canada. As such, it addresses the issues of the day in the time frames required and the Research Documents it contains are not intended as definitive statements on the subjects addressed but rather as progress reports on ongoing investigations.

Research Documents are produced in the official language in which they are provided to the Secretariat by the author.

<sup>1</sup> Cette série documente les bases scientifiques des conseils de gestion des pêches sur la côte atlantique du Canada. Comme telle, elle couvre les problèmes actuels selon les échéanciers voulus et les Documents de recherche qu'elle contient ne doivent pas être considérés comme des énoncés finals sur les sujets traités mais plutôt comme des rapports d'étape sur des études en cours.

Les Documents de recherche sont publiés dans la langue officielle utilisée par les auteurs dans le manuscrit envoyé au secrétariat.

### Abstract

In 1983, Canada caught only 4 t of redfish in Div. 30 and hence no 1983 catch rate data were available for this assessment. Although showing considerable fluctuations, catch rates have gradually increased since the early 1970's. The TAC's have not been achieved in recent years.

### Résumé

En 1983, le Canada n'a capturé que 4 t de sébaste dans la div. 30. Nous ne possédons donc pas de données sur les taux de capture sur lesquels fonder une évaluation de l'état de ce stock. Bien que montrant de fortes variations, les taux de capture augmentent graduellement depuis le début des années 1970. Les TPA n'ont pas été réalisés ces dernières années.

## Introduction

Nominal catches have ranged between 7,000 t and 18,000 t since 1972. In 1981 and 1982 only about 50% of the TAC's of 20,000 t were taken and provisional data for 1983 indicate only about 35% being taken. A lack of commercial data precludes any analytical assessment of this stock.

## Methods and Results

The redfish fishery in Div. 30 has been dominated by the USSR (Table 1) with fishing being conducted throughout the year but generally being greatest from about March to October (Table 2). Overall catches have fluctuated considerably (Fig. 1) and have steadily declined since 1979.

Because only 4 t were caught by Canada in 1983, no effort data are available for that year. The 1959-1982 directed (>50% redfish) data were obtained from ICNAF/NAFO and analysed using the multiplicative model (Gavaris 1980) weighted by effort. Maritimes data were not used again this year. In addition this year, the residuals were examined closely and a number (4) of outliers were discarded. These were associated with small catches but relatively high effort.

The results (Table 3) indicate a high degree of significance and the relative catch rates (Table 4) show a gradual increase since 1972. The standardized effort and catch rates can be seen in Fig. 2 and 3.

There are no research or commercial length frequencies available for 1983.

The available data do not suggest a change in the 1985 TAC from the present level of 20,000 t.
