#### Abstract

The commercial Atlantic salmon fishery moratorium implemented in 1992 entered its sixth year in 1997. The moratorium placed on the Northern Cod Fishery in 1992, which should have eliminated by-catch of Atlantic salmon in cod fishing gear in SFAs 1-9, continued in 1997. A moratorium was placed on cod fishing in SFAs 10-14A in August 1993, which remained in effect in 1997 with the exception of a limited fishery in SFA 11. Several indicators pointed to increased returns of small salmon in 1997 for many rivers, particularly those on the western side of the Northern Peninsula and on the northeast and east coasts: substantially increased spawning escapements in 1992 which were anticipated to result in increased returns of adults with a modal smolt age of 3+ years in 1997; indications of record high (or nearly so) smolt production in 1996; increasing trends in smolt survival and good condition of smolts; record early smolt run timing, associated with good adult returns in the past; marine thermal habitat conditions in early 1997 were among the best up to that point. However, with the exception of Bay St. George (SFA 13), overall returns of small salmon in 1997 decreased from 1996. Total population sizes of small salmon in 1997 were as low or lower than those estimated for several years immediately preceding the salmon moratorium. Sea survival decreased at all smolt-counting facilities except Highland's River (Bay St. George). Most evidence points to increased mortality at sea as being responsible for the lower than expected returns of small salmon. Returns of large salmon (mainly repeat spawning grilse) in 1997 increased at most counting facilities and in some cases were the highest on record. Smolt production in 1997 was the highest on record for four out of six rivers and among the highest in one. However, smolt run timing was late and this has been associated with decreased returns in the past in some rivers. Given there was record or near record smolt production in 1997, even a modest improvement in sea survival could result in increased returns in 1998.

#### Abstract

Résumé Le moratoire imposé à la pêche commerciale du saumon de l'Atlantique en 1992 en était à sa sixième année en 1997. Le moratoire aussi imposé en 1992 à la pêche de la morue du nord, qui devrait avoir fait disparaître les prises accessoires de saumon de la pêche de la morue dans les ZPS 1 à 9 , a été maintenu en 1997. Un moratoire a été imposé à la pêche de la morue dans les ZPS 10 à 14 en août 1993 et, à l'exception d'une pêche limitée dans la ZPS 11, il était encore en vigueur en 1997. Plusieurs indices font état d'une augmentation des remontées de petits saumons dans plusieurs rivières en 1997, notamment celles de la côte ouest de la péninsule nord et des côtes nord-est et est, à savoir: une augmentation appréciable des échappées de géniteurs en 1992 qui aurait dû donner lieu à des remontées accrues d'adultes d'un âge modal de saumoneaux de 3+ en 1997; des indices d'une production de saumoneaux record (ou presque) en 1996; une augmentation du taux de survie et de la condition des saumoneaux; une remontée hâtive record des saumoneaux associée à de bonnes remontées antérieures d'adultes; et les conditions thermiques de l'habitat marin au début de 1997 qui comptaient parmi les meilleures jamais notées. Par ailleurs, à l'exception de la baie St. George (ZPS 13), les remontées totales de petits saumons de 1997 étaient inférieures à celles de 1996. Les populations totales de petits saumons de 1997 étaient aussi faibles ou inférieures à celles estimées pour plusieurs années précédant immédiatement le moratoire de la pêche du saumon. À l'exception de l'installation de la rivière Highland (baie St. George), toutes les installations de dénombrement des saumoneaux ont indiqué une baisse de la survie en mer. La plupart des indices font état d'une augmentation de la mortalité en mer qui serait à l'origine de remontées de petits saumons plus faibles que prévues. Les remontées de grands saumons (surtout des madeleineaux ayant déjà frayé) de 1997 ont augmenté à la plupart des installations de dénombrement et, à certains endroits, étaient les plus élevées jamais enregistrées. La production de saumoneaux de 1997 était la plus élevée jamais notée pour quatre des six rivières et comptait parmi les plus élevées dans l'une d'elles. La remontée des saumoneaux a cependant été tardive et cela a déjà été associé à une baisse des remontées dans certaines rivières. Étant donné la production record ou presque record de saumoneaux en 1997, même une légère augmentation de la survie en mer pourrait donner lieu à une augmentation des remontées en 1998.

## Introduction

This paper presents the general status of Atlantic salmon stocks of insular Newfoundland, Salmon Fishing Areas (SFAs) 3-14A (Fig. 1) in 1997. Catch and effort data for the recreational fishery and counts at fishways and counting fences (smolts and adults) are examined in relation to historic data and management measures in effect in 1997.

## Management measures, past and present

The moratorium on the commercial Atlantic salmon fishery in insular Newfoundland continued in 1997. The implementation of the moratorium in 1992, which was accompanied by a commercial license retirement program, followed a major management plan introduced in 1984 (O'Connell et al. 1992a; May 1993; Mullins and Caines MS 1994), elements of which were continued into the quota years of 1990 and 1991 and the moratorium years. These regulations continue a longstanding history of management programs designed to prevent stock declines and to allow populations to rebuild (May 1993).

In addition to the closure of the commercial Atlantic salmon fishery in 1992, a moratorium was also placed on the Northern Cod Fishery, which should have eliminated by-catch in cod fishing gear in SFAs 1-9. This moratorium continued in 1997. In August 1993, a moratorium was placed on cod fishing in SFAs 10-14A which remained in effect in 1997, with the exception of a limited fishery in SFA 11.

The number of small salmon ( $<63 \mathrm{~cm}$ ) that could be retained in the recreational fishery in each SFA in 1992 and 1993 was limited by quota. The quota was assigned for each SFA as a whole as opposed to individual river quotas. Only hook-and-release fishing was permitted after the quota was caught in each SFA. Quotas were eliminated in 1994. The seasonal bag limit for the retention of small salmon in insular Newfoundland decreased from eight to six in 1994, three to be caught prior to July 31 and three after that date. Hook-and-release fishing only was permitted after the bag limit of three was reached in each time period. These measures remained in effect in 1995-97. There was a daily bag limit of two fish. As in previous years, the retention of large salmon ( $\geq 63 \mathrm{~cm}$ ) was not permitted in insular Newfoundland. The daily maximum number of fish that could be hooked and released was four. Angling ceased for the day when both the retention and hook-and-release limits were reached and ended for the season when six fish were retained.

On a river-specific basis, rivers in SFAs 9 and 10 were opened for hook-and-release fishing two weeks earlier than usual in 1997, after which time retention of catch was permitted until the end of the season, scheduled to end one week early. Colinet River in SFA 9 was opened to hook-andrelease fishing for the entire season in 1997, after many years of complete closure. Rivers in SFAs 11 and 12 were opened for hook-and-release fishing one week early followed by retention fishing until the end of the season (scheduled for one week earlier than usual). Several rivers in SFA 13 allowed hook-and-release fishing only for the entire season while others had a period of hook-andrelease only followed by retention. Main River (Sop's Arm) in SFA 3 was managed by a quota and Northwest Branch was open to hook-and-release fishing only; also certain areas were closed to all angling. Other rivers managed under quota in 1997 included Conne River in SFA 11, Serpentine

River, Fox Island River, and Adies Lake (upper Humber River) in SFA 13, and Lomond River, Watson's Brook, and Pincent's Brook in SFA 14A. A First People's food fishery was conducted at Conne River in 1997, the first in several years. As in 1996, there was no quota for Exploits River (SFA 4) in 1997. Retention of catch was permitted during June 21-August 16 below Grand Falls followed by hook-and-release fishing only. The main stem of the Exploits River between Grand Falls and Red Indian Lake and all tributaries flowing into Red Indian Lake were open to hook-and-release fishing for the entire season. Retention and hook-and-release dates for tributaries between Grand Falls and Red Indian Lake were the same as for below Grand Falls. The main stem of the Exploits River from Stoney Brook to Grand Falls was closed to all angling for the entire season. Other rivers or parts of rivers closed for the entire season included: Northeast Brook (Trepassey) and Rocky River (SFA 9); Highlands River, Harry's River above Home Pool, streams flowing into Adies Lake, Cook's Brook, and North Brook (Deer Lake) (SFA 13); Western Brook, Ten Mile Feeder (St. Genevieve River), and West River (SFA 14A). Northwest River (Terra Nova National Park) and two nearby rivers, Southwest River and Salmon River, in SFA 5, were closed to all angling in 1997 pending the results of an in-season review. There were fall hook-and-release fisheries (September 2-30) in Gander River (SFA 4) and in Humber River (SFA 13); as a result of projected low returns, the daily limit was reduced from four to two fish.

Most rivers in insular Newfoundland were closed to retention of small salmon in late July when an in-season review projected that overall levels of returns would be substantially lower than expected. Hook-and-release only fishing was permitted (only in the AM for rivers in SFAs 4 and 5) at that point; in early August however, low water levels forced the complete closure of most rivers until the end of the season. Details of openings and closures throughout the season on a river-specific basis in 1997 are provided in Table 1.

For the five-year period immediately preceding the commercial salmon fishery moratorium, the average number of recreational fishery licenses sold in Newfoundland and Labrador was 24493. Maximum license sales prior to the moratorium were recorded in 1988 (26445). By comparison, sales during the moratorium years were 25718 (1992), 26508 (1993), 22596 (1994), 21840 (1995), 26038 (1996), and approximately 20,800 in 1997.

## Methods

Catch and effort information and counts of salmon at counting facilities in 1997 were compared to two pre-salmon moratorium means (1984-89 and 1986-91) and to the 1992-96 mean during the moratorium. The 1984-89 mean corresponds to years under major management changes in the commercial fishery in the Newfoundland Region (O'Connell et al. 1992a). The commercial fishery in both insular Newfoundland and Labrador in 1990 and 1991 was controlled by a quota in each SFA (O'Connell et al. MS 1992b). The mix of management measures in effect during 1984-89 on the one hand and the imposition of commercial quotas in 1990 and 1991 on the other, should be kept in mind when making evaluations based on the 1986-91 mean.

Recreational fishery catch and effort data and fishway and counting fence data were added to that presented in O'Connell et al. (MS 1997a). Prior to 1997, recreational fishery data were
compiled as described by Ash and $\mathrm{O}^{\prime}$ Connell (1987a,b) and Mullins and Claytor (1989). Catch statistics for both retained and released small salmon were used in 1992-96. Catch information for released large salmon has been available since 1985 for SFAs 12 and 13. Recreational fishing effort was presented as rod days, defined as any day or part of a day on which an angler fishes.

Prior to 1997, angling data were provided by Department of Fisheries and Oceans (DFO) River Guardians. With a few exceptions, no data were collected by River Guardians in 1997. Angling data for 1997, which at this stage have to be regarded as preliminary, were derived from the License Stub Return System (O'Connell et al. MS 1998).

Means and 95\% confidence intervals for ratios were calculated according to Cochran (1977).

## Results and Discussion

## Smolt-to-adult survival

The smolt-to-adult survival of $3.4 \%$ for Campbellton River in 1997 (adult year) was by far the lowest recorded to date (Table 2). A survival of $2.9 \%$ was observed for Northeast Brook (Trepassey) (SFA 9) in 1997 which was the second lowest recorded, only slightly better than the low observed in 1992, and reversed an increasing trend. Rocky River (SFA 9) recorded a survival of $3.1 \%$, the lowest since 1993 and a decline from the high of 1996. Conne River (SFA 11) also showed a marked decrease in survival (3.4\%) in 1997, the worst since 1994 when the lowest level of the time series was recorded. Survival for Western Arm Brook (SFA 14A) in 1997 (3.5\%) was the lowest since 1991 and marked a substantial decrease from levels observed in 1995 and 1996.

Fig. 2 shows graphically the trends in sea survival for the rivers mentioned above and also the trend for Highlands River in SFA 13 (from Dempson et al. MS 1998). Survival adjusted for commercial exploitation is also shown for Conne River, Northeast Brook (Trepassey), and Western Arm Brook (see Dempson et al. MS 1998 for methodology). During moratorium years, estimates of sea survival from smolts to adult small or one-sea-winter (1SW) salmon are believed to represent natural survival rates. Despite major changes to fisheries and corresponding reductions in marine exploitation, sea survival rates were still less than $10 \%$, although this level has been achieved in both Conne River and Western Arm Brook during periods when commercial and by-catch fisheries were in operation. Conne River and Northeast Brook (Trepassey) experienced their lowest survival rates during the period of time that the Newfoundland commercial salmon fishery was closed. Ocean survival for both of these stocks was falling throughout the late 1980s and early 1990s; adjusted sea survival rates only serve to highlight the difference even more.

## Recreational fishery and counts at counting facilities

As pointed out earlier, data for 1997 are preliminary and were derived from the License Stub Return System. This method of collecting angling data represents a complete departure from the previous system which was based on information provided by DFO River Guardians. Details on the methodology employed in the Stub Return System and a comparison of stub data with DFO River

Guardian data for 1994-97 are provided in O'Connell et al. (MS 1998). Overall, estimates of released small and large salmon from the stub were substantially higher than estimates from River Guardians while the two methods were closer with respect to estimates of small salmon retained. This has to be kept in mind when comparing catches for 1997 with previous years. There is evidence that effort expenditure was under-reported by the stub and hence this information will not be used in the present document. Analyses are currently being carried out to adjust for under-reporting.

Recreational catches of small and large salmon for insular Newfoundland (SFAs 3-14A combined) are presented in Appendix 1a. Data for insular Newfoundland were also rolled into four subdivisions, Northern Peninsula East and Eastern (SFAs 3-8), South (SFAs 9-11), Southwest (SFAs 12-13), and Northern Peninsula West (SFA 14A) and are shown in Appendix 1b-e. Data for each individual SFA are shown in Appendix 1f-q. Catches for all years prior to 1992 represent retained fish only. There was no estimate of released fish during the period of retention of catch in 1992, which could impact on comparisons. For insular Newfoundland, Northern Peninsula East and Eastern, South, and individual SFAs 3-11, 1987 was not included in the means because in that year drought conditions resulted in the closure of most rivers to angling for the greater part of the season.

## Insular Newfoundland (SFAs 3-14A)

The total catch of small salmon (retained plus released fish) in the recreational fishery in all of insular Newfoundland in 1997 was comparable to the 1984-89 and 1986-91 means but below the 1992-96 mean (Fig. 3). The number of small salmon retained in 1997 was the lowest in the time series. Comparisons of catch in 1997 with data for 1996 and with means involving 1996 for all of insular Newfoundland is compromised, since such information for SFAs 12 and 13 were largely incomplete in 1996.

## Northern Peninsula East and Eastern (SFAs 3-8)

## Recreational fishery

The total catch of small salmon in 1997 was below the 1984-89, 1986-91, and 1992-96 means while the number of small salmon retained was the lowest recorded (Fig. 4).

## Counting facilities

SFA 3: A counting fence was operated for the second year in Northwest Branch tributary of Main River (Sop's Arm). The fence was not installed until July 8 in 1997 and therefore counts of small (Table 3) and large (Table 4) salmon have to be regarded as partial. The proportion of large salmon in 1997 was twice as high as in 1996 (Table 5).

SFA 4: Counts of small (Table 3) and large (Table 4) salmon are available for fishways located in the Exploits River (Bishop's Falls) and Salmon Brook (tributary of Gander River) and counting fences in Gander River and Campbellton River. Counts of small and large salmon for Exploits River in 1997 decreased from 1996 and the 1992-96 mean but increased over the 1984-89 and 1986-91 means (see also Figs. 5 and 6). The count of small salmon for Campbellton River in

1997 decreased from 1996 and the mean while large salmon decreased from 1996 but increased over the mean. The count of small salmon at the Gander River counting fence in 1997 decreased from 1996 and the 1992-96 mean but remained above the 1986-91 mean; the count of large salmon showed a slight increase over 1996, declined slightly from the 1992-96 mean, but was substantially above the 1986-91 mean. The count of small salmon at the Salmon Brook fishway in 1997 decreased from 1996 and the means; the reverse was true for large salmon.

The proportion of large salmon for Exploits River in 1997 was similar to the high recorded in 1996 and above the means (Table 5 and Fig. 7). The proportion of large salmon for Campbellton River in 1997 was slightly below the high recorded in 1996 and above the mean. At the Gander River counting fence, the proportion of large salmon in 1997 was the highest since 1992 and above the means; the proportion for Salmon Brook was the highest since the start of the commercial fishery moratorium and exceeded the means.

SFA 5: Counts of small (Table 3 and Fig. 8) and large (Table 4 and Fig. 9) salmon are available from fishways in Middle Brook and Terra Nova River (upper and lower) and counting fences in Northwest River, Terra Nova National Park (since 1995), and Indian Bay Brook (operated for the first time in 1997). The count of small salmon at Middle Brook in 1997 decreased from 1996 and the 1992-96 mean but increased over the 1984-89 and 1986-91 means; the count of large salmon was the highest on record. At the lower Terra Nova River fishway, the count of small salmon in 1997 decreased from 1996 and the 1992-96 mean but remained above the 1984-89 and 1986-91 means; the count of large salmon increased over 1996 and the means. The counts of small and large salmon for the lower Terra Nova River in 1993 were incomplete due to fish bypassing the fishway. This was caused by the washout of the diversion dam above the fishway and unusually high water levels. However, since counts in 1993 were the highest ever recorded for small salmon (and highest up to that year for large salmon), they were included in the 1992-96 means. Counts of small and large salmon at the upper Terra Nova River fishway in 1997 decreased from 1996 and the 1992-96 mean but increased over the 1984-89 and 1986-91 means. Counts of small (Table 3) and large (Table 4) salmon for Northwest Brook in 1997 were partial. At the Indian Bay Brook counting fence, 1375 small and 352 large salmon were counted.

The proportions of large salmon for Middle Brook and lower Terra Nova River in 1997 were the highest since the start of the commercial salmon fishery moratorium, exceeding all means (Table 5 and Fig. 10). The proportion for upper Terra Nova River increased over 1996, was similar to the 1992-96 mean and surpassed the 1984-89 and 1986-91 means. The proportion for Northwest River decreased slightly from 1995 and 1996 which in turn were similar. The proportion of large salmon in Indian Bay Brook in 1997 was 0.204 .

South (SFAs 9-11)

## Recreational fishery

The total catch of small salmon in 1997 decreased from 1996 and the 1984-89 and 1992-96 means but was similar to the 1986-91 mean (Fig. 11). The number of small salmon retained in 1997 decreased from 1996 and the means.

## Counting facilities

SFA 9: Counts of small (Table 3 and Fig. 12) and large (Table 4 and Fig. 13) salmon are available from a counting fence in Northeast Brook (Trepassey) and a fishway in Rocky River. Counts of small and large salmon in Northeast Brook (Trepassey) decreased from 1996 and the means. The reverse was true for both small and large salmon for Rocky River.

The proportion of large salmon in Northeast Brook (Trepassey) in 1997 decreased from 1996 (slightly) and the 1984-89 and 1986-91 (slightly) means and was similar to the 1992-96 mean (Table 5 and Fig. 14). The proportion for Rocky River in 1997 was the second highest of the moratorium years and exceeded the means.

SFA 10: Counts of small (Table 3 and Fig. 15) and large (Table 4 and Fig. 16) salmon are provided by a fishway located in Northeast River (Placentia). The count of small salmon in 1997 decreased from 1996 and the 1992-96 mean but increased over the 1984-89 and 1986-91 means. The count of large salmon was the highest on record.

The proportion of large salmon was the highest recorded since the moratorium started, substantially increasing over 1996 and the means (Table 5 and Fig. 17).

SFA 11: Counts of small (Table 3 and Fig. 18) and large (Table 4 and Fig. 19) salmon are available from a counting fence in Conne River and a fishway located in Grand Bank Brook. The count of small salmon in Conne River in 1997 decreased from 1996 and the means (only slightly in the case of the 1992-96 mean). The count of large salmon was similar to 1996, decreased from the 1984-89 and 1986-91 means but increased over the 1992-96 mean. At Grand Bank Brook, the count of small salmon in 1997 decreased from 1996 and the 1984-89 and 1986-91 means but remained similar to the 1992-96 mean. The count of large salmon was the same as or similar to 1996 and the 1992-96 mean and increased over the remaining means.

The proportion of large salmon in Conne River in 1997 was the second highest since the moratorium and increased over the means (Table 5 and Fig. 20). The proportion for Grand Bank Brook was also the second highest of the moratorium years, increased over the 1984-89 and 1986-91 means, but was similar to the 1992-96 mean.

## Southwest (SFAs 12-13)

Recreational fishery
The catch information presented in the tables and figures for this subdivision and individual SFAs is incomplete as pointed out above. This plus the cautions associated with stub estimates of catch compared to River Guardian estimates make comparisons rather tenuous. However, aside from 1996, the total catch of small salmon in 1997 was one of the highest on record (Fig. 21). The number of large salmon released was the highest on record. The number of small salmon retained in 1997 was among the lowest.

Counting facilities
SFA 13: Counts of small (Table 3 and Fig. 22) and large (Table 4 and Fig. 23) salmon are available from counting fences in Highlands River and Pinchgut Brook and from population estimates derived from mark-recapture studies in Humber River (Mullins MS 1998). Counts of small and large salmon in Highlands River in 1997 were the highest on record. The count of small salmon in Pinchgut Brook in 1997 was similar to 1996 and the 1992-96 mean while the count of large salmon was the highest recorded. The estimated population size of small salmon for Humber River in 1997 decreased from 1996 and the 1992-96 mean. The estimate for large salmon decreased from 1996 but was above the mean.

The proportion of large salmon in Highlands River in 1997 was the lowest of the moratorium years while the reverse was true for Pinchgut Brook and Humber River (Table 5 and Fig. 24).

## Northern Peninsula West (SFA 14A)

## Recreational fishery

The total catch of small and large salmon in 1997 decreased from 1996 and the 1992-96 mean but increased over the 1984-89 and 1986-91 means (Fig. 25). The number of small salmon retained was one of the lowest on record, well below 1996 and the means.

## Counting facilities

Counts of small (Table 3 and Fig. 26) and large (Table 4 and Fig. 27) salmon are available from fishways located in Lomond River and Torrent River and a counting fence in Western Arm Brook. The count of small salmon in Lomond River in 1997 increased over 1996 and the means. The count of large salmon decreased from 1996, was similar to the 1992-96 mean, and increased over the 1984-89 and 1986-91 means. Counts of small salmon in Torrent River and Western Arm Brook in 1997 decreased from 1996 and the 1992-96 mean but increased over the 1984-89 and 198691 means. Counts of large salmon for these two rivers were the highest on record.

Proportions of large salmon in Torrent River and Western Arm Brook in 1997 were the highest on record while that of Lomond was the second highest (Table 5 and Fig. 28).

## Total population size

Since the closure of the commercial salmon fishery in 1992, returns of small and large salmon to rivers are assumed to be total population sizes. Total population size prior to the moratorium can be estimated by adjusting for commercial exploitation (Dempson et al. MS 1997). Total population sizes of small (Figs. 29-31) and large (Figs. 32-34) salmon for most of the rivers presented above in 1984-97 are available from Dempson et al. (MS 1998).

While the decline in returns of small salmon in 1997 was quite dramatic in many cases, declines of $\geq 40 \%$ from one year to the next are not uncommon in insular Newfoundland. Indeed,
this has occurred on a number of occasions over the past decade. Where this is problematic is when the total population size is considered over the long term. When returns prior to 1992 are adjusted for commercial exploitation, then 1997 is either the lowest (Terra Nova River and Gander River), or among the lowest (Middle Brook, Northeast Brook (Trepassey), Northeast River (Placentia), Conne River, Humber River, and Western Arm Brook) stock sizes recorded or estimated since 1984, or since records have been available (e.g., Gander River).

Whereas many rivers had declining returns of small salmon in 1997, a drop in large salmon returns was the exception rather than the rule. In many cases, large salmon returns (mainly repeat spawning grilse) and the proportions of large salmon in returns increased to the highest levels observed during the moratorium. Where there were decreased returns of both small and large salmon (Exploits River, Campbellton River, Northeast Brook (Trepassey), and Humber River), the proportionate decline from 1996 was similar for both size components.

While much attention has been focused around the substantial declines in 1997 returns, mostly of small salmon, little attention has been directed towards either the lack of response in some south coast stocks during the moratorium years or their continued decline over the long term (Biscay Bay River (no data for this river for 1997), Northeast Brook (Trepassey), and Conne River). Exceptions to this are Rocky River and Northeast River (Placentia). Low returns again in 1997 just continue a persistent problem. It is only because of the apparent increased or above average smolt levels in recent years (Table 2) that stocks have not fallen to even lower levels.

## Net marks

The incidence of net-marked fish has been determined for a number of rivers throughout insular Newfoundland since 1994. The results for small and large salmon combined are presented below (from Dempson et al. MS 1998):

| River | $\mathbf{1 9 9 4}$ | $\mathbf{1 9 9 5}$ | $\mathbf{1 9 9 6}$ | $\mathbf{1 9 9 7}$ |
| :--- | :---: | :---: | :---: | :---: |
| Gander River | 15.9 | 8.9 | 12.2 | 15.9 |
| Campbellton River | 6.2 | 5.0 | 4.3 | 4.3 |
| Conne River | 18.6 | 7.1 | 6.2 | 7.2 |
| Highlands River | 0.0 | 0.7 | 0.9 | 0.5 |
| Harry's River |  |  | 0.6 | 9.3 |
| Humber River |  | 1.4 | 2.6 | 7.6 |

The incidence in 1997 increased over that of 1996 for all rivers except Campbellton River (remained the same) and Highlands River (decreased). The most dramatic increases occurred in the case of Harry's River. It should be noted that traps were located near the head of tide for all rivers except Harry's River, where fish were examined in Pinchgut Brook, a long distance from the mouth of the river. For rivers other than Harry's River, net marks were likely the result of encounters with legally
set gear for other species and with illegal gear in the marine environment; some net-marks may have occurred in freshwater in Harry's River.

## Comments and Conclusions

Management changes in the recreational fishery, specifically the implementation and changing of quotas in SFAs along with mandatory hook-and-release fishing, and changing daily and seasonal bag limits, have seriously compromised the usefulness of angling data in terms of comparability with the past, especially when used as indices of abundance. Adding hook-and-release fish to retained fish, and comparing this total to retained fish for years prior to 1992, assumes the amount of effort expended applies equally to hook-and-release and retained fish. Reports from user groups suggest less effort was directed towards hook-and-release fishing. Also, there have been variable and prolonged closures of rivers to angling over the years due to low water levels and high water temperatures. Angling catches in 1997 were affected by complete closures of most rivers for most of August. Added to this are the confounding elements associated with the derivation of 1997 angling data from the License Stub Return System. In the interpretation of trends and drawing of conclusions with respect to abundance, more weight is placed on information obtained from counting facilities than on recreational fishery data.

The low returns of small salmon to insular Newfoundland rivers in 1997, particularly those on the western side of the Northern Peninsula and along the northeast and east coasts, were unexpected. Just as unexpected were the increased returns to rivers in Bay St. George (SFA 13), as indicated by returns to Highlands River (Table 3) and other Bay St. George rivers (Porter and Bourgeois MS 1998). Several indicators pointed to increased returns of small salmon in 1997 for many rivers:

- There were substantial increases in spawning escapements in 1992, the first year of the moratorium, which were anticipated to result in increased returns of adults with a modal smolt age of $3+$ years in 1997 (Table 6)
- Smolt production in 1996 was either the highest on record or among the highest (Table 2)
- Following periods of either declining or stable sea survival, several populations showed evidence of increasing trends (Fig.2) and smolt condition was good (Dempson et al. MS 1998)
- Smolt run timing was the earliest on record for most rivers in 1996; usually, early run timing has been associated with good adult returns in some rivers (Dempson et al. MS 1998)
- There was evidence that marine thermal habitat conditions in early 1997 were among the best to date (Dempson et al. MS 1998).

A workshop was convened in February 1998 in Sydney, Nova Scotia in an attempt to determine possible causes of the low returns in 1997 not only to Newfoundland and Labrador, but also to Atlantic Canada in general and to the United States. Factors examined that could possibly have contributed to low returns were legal and illegal fisheries, marine environmental conditions, predation, disease, parasites, and others such as delayed maturation. Most evidence points to increased mortality at sea, but no single factor could be identified that could explain the cause of the lower than expected returns. In the case of insular Newfoundland, a feature that stood out was the record early entry of smolts into the sea in 1996; there is no suggestion that early smolt migrations occurred anywhere else in Atlantic Canada or in the Unites States 1996. This suggests that while some common factor or factors cannot be ruled out, causes may also be different from river to river. A summary of the findings of the workshop is available in (CSAS 1998) and particulars of the Newfoundland Region analyses presented at the workshop are found in (Dempson et al. MS 1998).

It is interesting that smolt production in insular Newfoundland in 1997 was the highest recorded in four out of six rivers and among the highest in one other (Fig. 2), and run timing was either the latest recorded or among the latest (Dempson et al. MS 1998). Egg depositions in 1993, the second year of the moratorium, were maintained at levels similar to those of 1992 (Table 6). Considering the turn around in sea survival for the 1996 smolt class, predictions of levels of adult returns for 1998 at this stage are rather tenuous.

## Acknowledgements

We thank C. E. Bourgeois for providing the counts for Exploits, upper Terra Nova, and Rocky rivers for 1997 and previous years and the smolt data for Rocky River.

Table 1. Opening and closure dates of the Atlantic salmon recreational fishery for each SFA, and variations by river, 1997.

SFA 1 June 21 - Sept 14
SFA 2 June 21 - Sept 14
SFA 3 June 21 - Sept 1
Main River (Sops Arm), June 21 - July 4, catch and release only on entire river system;
July 5 - September 1, catch and retain on main stem only, Quota of 500 fish.
Main stem will revert to catch and release after quota is taken.
Northwest Branch will be open to catch and release only for the entire season.

| River | Close dates | Reason for closure |
| :--- | :--- | :--- |
| $\left.\begin{array}{lll}\text { All rivers in zone } 3 \text { closed to retention } & \text { Aug 15 } & \text { Low spawner returns } \\ \text { (hook and release only) } & & \end{array}\right]$ |  |  |

SFA 4 June 21 -Sept 1

- All rivers in zone 4 closed to retention July 28 Low spawner returns (hook and release only in AM)
- The following rivers closed to angling: $\quad$ August $1 \quad$ Low water levels $\&$ high water temperatures Campbellton River Dog Bay River Ragged Harbour River
Anchor Brook
Deadmans River
Windmill River
All Tributaries of Gander River
- All rivers in Zone 4 (except above rivers which closed due to low water ) opened August 20 for all day catch and release.
- The main stem of the Gander River opened for a catch-and-release fall fishery during September 2-30 inclusive. However, due to low spawner returns the daily limit has been reduced to two .

SFA 5 June 21 - Sept 1

- All rivers in zone 5 closed to retention July 28 Low spawner returns (hook and release only in AM)
- All rivers in zone 5 closed to angling $\quad$ August 2 Low water levels $\&$ high water temperatures
- All rivers in the southern portion of zone 5 (Bonavista Bay), including the main stem of the Terra Nova River (but not its tributaries) opened to all day catch and release on August 20. Northwest, Salmon, and Southwest rivers in the Port Blandford area remained closed.

SFA 6 June 21 -Sept 1

- All rivers in zone 6 closed to retention

July 28
Low spawner returns (hook and release only)

- All rivers in zone 6 closed to angling

August $2 \quad$ Low water levels \& high water temperatures

- All rivers in zone 6 (Trinity Bay) opened August 20 to all day catch and release.

SFA 7 June 21 - Sept 1

- North Arm River, Holyrood closed to all angling July 14 Low spawner returns
- All rivers in zone 7 closed to retention July 28 Low spawner returns (hook and release only)
- All rivers in zone 7 closed to angling August 2 Low water levels $\&$ high water temperatures
- All rivers in zone 7 (Conception Bay) opened August 20 to all day catch and release.

SFA 8 June 21 -Sept 1
$\begin{array}{cll}\text { - All rivers in zone } 8 \text { closed to retention } & \text { July } 28 & \text { Low spawner returns } \\ \text { (hook and release only) } & & \\ \text { - All rivers in zone } 8 \text { closed to retention } & \text { August } 2 & \text { Low water levels \& high water temperatures }\end{array}$

- All rivers in zone 8 (Southern Shore) opened August 20 to all day catch and release.

Table 1. Cont'd

SFA 9 June 7-20 hook and release; June 21 - Aug 24 retention.

- All rivers in zone 9 closed to retention (hook and release only)
- All rivers in zone 9 closed to angling

July 28
August $2 \quad$ Low water levels $\&$ high water temperatures

SFA 10 June 7-20 hook and release; June 21 - Aug 24 retention.

- The following rivers closed to all angling: July 23 Low water levels \& high water temperatures Southeast River (Plac.) Northeast River (Plac.) Two sections of Salmonier River
- The following rivers closed to all angling

July $25 \quad$ Low water levels \& high water temperatures
Cape Roger River
Nonsuch River
Bay de L'Eau River
Garnish River
Long Harbour River

- All rivers in zone 10 closed to retention July 28 Low spawner returns (hook and release only)
- All rivers in zone 10 closed to angling August 2 Low water levels \& high water temperatures

## SFA 11 June 7-13 hook and release; June 14-Aug 24 retention.

- Conne River: June 7-20 hook and release; June 21 onward retention until 200 fish taken then reverts to hook and release
- Conne River closed to all angling June 27 Low spawner returns
- All rivers in zone 11 closed to retention
July 28 Low spawner returns (hook and release only)
- Grand Bank Brook closed to all angling August 2 Low water levels \& high water temperatures

SFA 12 June 7-13 hook and release; June 14-Aug 24 retention.

- All rivers in zone 12 closed to retention July 28 Low spawner returns (hook and release only)

SFA 13 June 1 - Sept 1

- Fox Island River closed to retention July 25
- Serpentine River closed to retention July 25
- All rivers in zone 13 closed to retention July 28

Quota 50 fish taken Quota 150 fish taken (hook and release only)

- The lower Humber River will be open for a catch-and-release fall fishery during September 2-30 inclusive. However, due to low spawner returns the daily limit has been reduced to two .

SFA 14A June 21 - Sept 1

- Torrent River opened to retention July 8
- All rivers in zone 14A closed to retention (hook and release only)

750 fish gone through fishway
August 15 Low spawner returns

SFA 14B June 21 - Sept 14

- All rivers in zone 14B closed to retention (hook and release only)
- Forteau River closed to all angling
- L'anse au loup Brook closed to all angling

August 15 Low spawner returns
August 15 Low spawner returns
August 15 Low spawner returns

The Department of Fisheries and Oceans announced on August 15, that anglers may no longer retain any salmon caught in non-scheduled waters anywhere in the province (including all of the provinces coastal waters).

Table 2. Atlantic salmon smolt-to-adult survival (back to the river) for Campbellton River (SFA 4), Northeast Brook, Trepassey, and Rocky River (SFA 9), Conne River (SFA 11). Highlands River (SFA 13), and Western Arm Brook (SFA 14A). Repeat spawners are included in counts

Table 4. Counts of large salmon from fishways and counting fences in insular Newfoundland 1974-97 by Salmon Fishing Area (SFA). Also shown are means ( $\overline{\mathrm{X}}$ ), coefficients of variation (CV), 95\% confidence limits (LCL and UCL) and percentage change for 1997 in relation to 1996 and the 1984-89, 1986-91, and 1992-96 means. Partial counts are in parentheses and are not included in statistical calculations. Adjusted counts are bold and in italics.

Table 5. Proportions of large salmon at counting facilities in Newfoundland during 1992-97 and mean proportions for 1984-89, 1986-91, and 1992-96.

Fig. 1. Map showing the 14 Salmon Fishing Areas of the Newfoundland Region.

Fig. 2. Estimates of marine survival from smolts in year $i$ to adult small salmon in year $i+1$. Dashed line represents marine survival adjusted for average marine exploitation rate (from Dempson et al. MS 1998).

Fig. 3. Recreational catch of small salmon (retained, 1974-97; retained plus released, 1992-97), for Insular Newfoundland (SFAs 3-14A). The thin solid horizontal line represents the 1984-89 mean, the thin broken horizontal line the 1986-91 mean, the thick solid line the 1992-96 mean (retained + released) and the thick broken line the 1992-96 mean (retained only). Catch totals for 1996 are incomplete because data were unavailable for several rivers in SFAs 12 and 13. The 1997 data, obtained from the licence stub return, are preliminary and are represented by single points which are not continuous with the lines.

Fig. 4. Recreational catch of small salmon (retained, 1974-97; retained plus releasesd, 1992-97), for Northern Peninsula East and Eastern (SFAs 3-8). The thin solid horizontal line represents the 1984-89 mean, the thin broken line the 1986-91 mean, the thick solid line the 1992-96 mean (retained + released), and the thick broken line the 1992-96 mean (retained only). The 1997 data, obtained from the licence stub return, are preliminary and are represented by single points which are not continuous with the lines.

## Campbellton River <br> Counting Fence(Small)

Gander River
Counting Fence (Small)

Fig. 5. Counts of small salmon at the Bishop's Falls fishway (main stem of the Exploits River), the Campbellon River counting fence and at the Gander River counting fence and the fishway located in the Salmon Brook tributary, SFA 4. The thin solid horizontal line represents the 1984-89 mean, the broken line the 1986-91 mean, and the thick solid line the 1992-96 mean. $A=$ adjusted count and $P=$ partial count, not included in the means.

Fig. 6. Counts of large salmon at the Bishop's Falls fishway (main stem of the Exploits River), the Campbellton River counting fence and at the Gander River counting fence and the fishway located in the Salmon Brook tributary, SFA 4. The thin solid horizontal line represents the 1984-89 mean, the broken line the 1986-91 mean, and the thick solid line the 1992-96 mean. $A=$ adjusted count and $P=$ partial count, not included in the means.

Fig. 7. Proportion of large salmon for Exploits River (Bishop's Falls), Campbellton River, Gander River counting fence and the fishway on the Salmon Brook tributary, SFA 4, 1992-97, and the 1984-89, 1986-91 and 1992-96 means.

## Middle Brook

Fishway (Small)

Terra Nova River
Lower Fishway (Small)

Terra Nova River
Upper Fishway (Small)

Fig. 8. Counts of small salmon at the Middle Brook fishway, and at the lower and upper fishways in Terra Nova River, SFA 5. The thin solid horizontal line represents the 1984-89 mean, the broken line the 1986-91 mean, and the thick solid line the 1992-96 mean. $P=$ partial count, not included in the means.

Fig. 9. Counts of large salmon at the Middle Brook fishway, and at the lower and upper fishways in Terra Nova River, SFA 5. The thin horizontal line represents the 1984-89 mean, the broken line the 1986-91 mean, and the thick solid line the 1992-96 mean. $P=$ partial count, not included in the means.

Fig. 10. Proportion of large salmon for Middle Brook, the upper and lower Terra Nova River, and Northwest River (Terra Nova Nat. Park), SFA 5, 1992-97, and the 1984-89, 1986-91, and 1992-96 means.

Fig. 11. Recreational catch of small salmon (retained, 1974-97; retained plus releasesd, 1992-97), for South (SFAs 9-11). The thin solid horizontal line represents the 1984-89 mean, the thin broken line the 1986-91 mean, the thick solid line the 1992-96 mean (retained + released), and the thick broken line the 1992-96 mean (retained only). The 1997 data, obtained from the licence stub, are preliminary and are represented by single points which are not continuous with the lines.

Fig. 12. Counts of small salmon at the counting fence in Northeast Brook (Trepassey) and at the fishway in Rocky River, SFA 9. The thin solid horizontal line represents the 1984-89 mean, the broken line the 1986-91 mean and the thick solid line the 1992-96 mean.

Rocky River
(Large)

Fig. 13. Counts of large salmon at the counting fence in Northeast Brook (Trepassey), and at the fishway in Rocky River, SFA 9. The thin solid horizontal line represents the 1984-89 mean, the broken line the 1986-91 mean and the thick solid line the 1992-96 mean.

Fig. 14. Proportion of large salmon for Northeast Brook (Trepassey), and Rocky River, SFA 9, 1992-97, and the 1984-89, 1986-91 and 1992-96 means.

Fig. 15. Counts of small salmon at the Northeast River (Placentia) fishway, SFA 10. The thin solid horizontal line represents the 1984-89 mean, the broken line the 1986-91 mean and the thick solid line the 1992-96 mean. $P=$ partial count.

## Northeast River, Placentia

Fishway (Large)

Fig. 16. Counts of large salmon at the Northeast River (Placentia) fishway, SFA 10. The thin solid horizontal line represents the 1984-89 mean, the broken line the 1986-91 mean and the thick solid line the 1992-96 mean. $\mathrm{P}=$ partial count.

Fig. 17. Proportion of large salmon for Northeast River (Placentia), SFA 10, 1992-97 and the 1984-89, 1986-91, and 1992-96 means.

Fig. 18. Counts of small salmon at the Grand Bank Brook fishway and the Conne River counting fence, SFA 11. The thin solid horizontal line represents the 1984-89 mean, the broken line the 1986-91 mean, and the thick solid line the 1992-96 mean. $P=$ partial count, not included in the means.

## Grand Bank Brook (Large)

Conne River
(Large)

Fig. 19. Counts of large salmon at the Grand Bank Brook fishway and the Conne River counting fence, SFA 11. The thin solid horizontal line represents the 1984-89 mean, the broken line the 1986-91 mean, and the thick solid line the 1992-96 mean. $P=$ partial count, not included in the means.

Fig. 20. Proportion of large salmon for Grand Bank Brook, and Conne River, SFA 11, 1992-97, and the 1984-89, 1986-91 and 1992-96 means.

## Southwest (SFAs 12-13)

Recreational Catch - Small Salmon

Recreational Catch - Large Salmon

Fig. 21. Recreational catch of small salmon (retained, 1974-97; retained plus releasesd, 1992-97), for Southwest (SFAs 12-13). The catch of large salmon prior to1985 is retained and for 1985-97 is released. The thin solid horizontal line represents the 1984-89 mean, the thin broken line the 1986-91 mean, the thick solid line the 1992-96 mean (retained + released), and the thick broken line the 1992-96 mean (retained only). Catch totals for 1996 are incomplete because data were unavailable for several rivers in SFAs 12 and 13. The 1997 data, obtained from the licence stub return, are preliminary and are represented by single points which are not continuous with the lines.

Highlands River
(Small)

Pinchgut Brook
(Small)

Humber River
(Small)

Fig. 22. Counts of small salmon at counting fences in Highlands River and Pinchgut Brook and the mark-recapture study in Humber River, SFA 13. The thick solid horizontal line represents the 1992-96 mean.

Highlands River
(Large)

Pinchgut Brook
(Large)

Humber River
(Large)

Fig. 23. Counts of large salmon at counting fences in Highlands River and Pinchgut Brook and the mark-recapture study in Humber River, SFA 13. The thick solid horizontal line represents the 1992-96 mean.

Fig. 24. Proportion of large salmon for Highlands River, Pinchgut Brook, and Humber River, SFA 13, 1992-97, and the 1984-89, 1986-91 and 1992-96 means.

## Northern Peninsula West (SFA 14A)

Recreational Catch -Small Salmon

$x \quad($ Retained + Released $)=($ Retained $)$

Fig. 25. Recreational catch of small salmon (retained, 1974-97; retained plus releasesd, 1992-97), for Northern Peninsula West (SFA 14A). The catch of large salmon prior to1985 is retained and for 1985-97 is released. The thin solid horizontal line represents the 1984-89 mean, the thin broken line the 1986-91 mean, the thick solid line the 1992-96 mean (retained + released), and the thick broken line the 1992-96 mean (retained only). The 1997 data, obtained from the licence stub return, are preliminary and are represented by single points which are not continuous with the lines.

Fig. 26. Counts of small salmon at fishways in Lomond River and Torrent River and at the counting fence in Western Arm Brook, SFA 14A. The thin solid horizontal line represents the 1984-89 mean, the broken line the 1986-91 mean, and the thick solid line the 1992-96 mean. $A=$ adjusted count.

Fig. 27. Counts of large salmon at fishways in Lomond River and Torrent River and at the counting fence in Western Arm Brook, SFA 14A. The thin solid horizontal line represents the 1984-89 mean, the broken line the1986-91 mean, and the thick solid line the 1992-96 mean.

Fig. 28. Proportion of large salmon for Lomond River, Torrent River, and Western Arm Brook, SFA 14A, 1992-97, and the 1984-89, 1986-91 and 1992-96 means.

Fig. 29. Estimated total returns of small Atlantic salmon to Northeast and East coast Newfoundland rivers, 1984-1997. Dashed lines represent stock size adjusted for marine exploitation (from Dempson et al. MS 1998).

Fig. 30. Estimated total returns of small Atlantic salmon to South coast Newfoundland rivers, 1984-97. Dashed lines represent stock size adjusted for marine exploitation, here showing the upper and lower confidence intervals derived from the mean exploitation on other stocks, except for Northeast River (Placentia) which uses its own individual value (from Dempson et al. MS 1998).

Fig. 31. Estimated total returns of small Atlantic salmon to West and Northwest coast Newfoundland rivers, 1984-1997. Dashed lines represent stock size adjusted for marine exploitation (from Dempson et al. MS 1998).

Fig. 32. Estimated total returns of large Atlantic salmon to Northeast and East coast Newfoundland rivers, 1984-1997. Dashed lines represent stock size adjusted for marine exploitation (from Dempson et al. MS 1998).

Fig. 33. Estimated total returns of large Atlantic salmon to South coast Newfoundland rivers, 1984-97. Dashed lines represent stock size adjusted for marine exploitation, here showing the upper and lower confidence intervals derived from the mean exploitation on other stocks, except for Northeast River (Placentia) which uses its own individual value (from Dempson et al. MS 1998).

Fig. 34. Estimated returns of large Atlantic salmon to West and Northwest coast Newfoundland rivers, 1984-1997. Dashed lines represent stock size adjusted for marine exploitation (from Dempson et al. MS 1998).

Appendix 1a. Atlantic salmon recreational fishery catch and effort data for insular Newfoundland (SFAs 3-14A), 1974-97 Ret $=$ retained fish; Rel. $=$ released fish. The 1997 data, obtained from the licence stub return, are preliminary

## 1987 DATA NOT INCLUDED IN MEAN

In THE ABOVE TABLE A PERIOD INDICATES NO DATA FOR THAT YEAR.
CPUE IS BASED ON RETAINED + RELEASED FISH FOR 1992-97 AND ON RETAINED FISH ONLY PRIOR TO 1992.

* NOT ALLOWED TO RETAIN LARGE SALMON IN INSULAR NEWFOUNDLAND.

Appendix 1d. Atlantic salmon recreational fishery catch and effort data for Southwest (SFAs 12 \& 13), 1974-97 Ret $=$ retained fish; Rel. $=$ released fish. The 1997 data, obtained from the licence stub return, are preliminary.

IN THE ABOVE TABLE A PERIOD INDICATES NO DATA FOR THAT YEAR.
CPUE IS BASED ON RETAINED + RELEASED FISH FOR 1985-97 AND ON RETAINED FISH ONLY PRIOR TO 1985.

- NOT ALLOWED TO RETAIN LARGE SALMON IN INSULAR NEWFOUNDLAND.
"DATA OBTAINED FROM THE LICENSE STUB RETURN AND ARE PRELIMINARY

[^0]:    *Conne River is evaluated against a Management Target which is higher than the corresponding conservation egg requirement.
    **Colonization program at Little River. Eggs removed from most adult returns, incubated, and fry subsequently stocked into the system. Conservation requirement achieved includes natural egg deposition and fry stocking egg equivalents.
