#### Abstract

Information was presented on catch statistics for Labrador in angling fisheries and aboriginal food fisheries in 2001 along with environmental data collected at gauging stations on selected rivers. Total return information was summarised from counting facilities. Total landings of 6,478 salmon weighing $16,288 \mathrm{~kg}$ were recorded for the food fisheries in Labrador. Landings recorded by the angling fishery were 1,929 small salmon retained, 5,401 small salmon released, 326 large salmon retained and 1,566 large salmon released. Water levels in Labrador rivers were high in the spring and low throughout most of the summer. Low water continued well into the fall.

#### Abstract

Résumé On présente des statistiques sur les prises de la pêche sportive et de la pêche autochtone à des fins alimentaires réalisées au Labrador en 2001, des données environnementales recueillies à des stations hydrométriques dans des rivières déterminées et un résumé des renseignements sur les remontes totales recueillis aux installations de dénombrement. Les pêcheurs autochtones ont déclaré des prises totales de 6478 saumons, pesant 16288 kg , tandis que les pêcheurs sportifs ont déclaré des prises de 1929 petits saumons retenus, 5401 petits saumons relâchés, 326 gros saumons retenus et 1566 gros saumons relâchés. Le niveau d'eau dans les rivières du Labrador était élevé au printemps et faible pendant presque tout l'été, ce qui a été le cas jusque tard à l'automne.

## INTRODUCTION

In 1992, several major changes were introduced to the management of Atlantic salmon in Newfoundland and Labrador. A five-year moratorium was placed on commercial salmon fishing in the island portion of the province, quotas for the Labrador commercial fishery, first introduced in 1990, were further reduced and a voluntary retirement of commercial salmon licences was instituted for all of the province. Beginning in 1997, the commercial fishery was closed in the Straits area of Labrador in Salmon Fishing Area (SFA) 14B and then in 1998, it was closed in the remaining SFAs $1 \& 2$ (Fig. 1). Fishers were offered a buyout which most accepted. In 1999-2001, a food fishery of 10 tonnes was available for members of the Labrador Inuit Association including Lake Melville, which is also in SFA 1. The Innu Nation fishes for salmon in Lake Melville and from the community of Davis Inlet and generally restrict themselves to harvests of around three tonnes. Beginning in 2000 and continuing into 2001, residents of Labrador were allowed to fish for trout with a permitted bycatch of four salmon. The west Greenland commercial salmon fishery, which was closed for the 1993 and 1994 fishing seasons, was re-opened in 1995 and closed again in 1999, leaving only a small subsistence food fishery in 2000. In 2001, the commercial Greenland fishery was opened with a structured quota system that depended on abundance based on inseason catches and historical averages to determine potential landings. Although there have been no recent tagging studies to document the distribution of Labrador salmon at sea, some Labrador origin multi-sea winter salmon may be caught in the Greenland fishery similar to what was shown for Labrador stocks in earlier studies by Pratt et al. (1974).

There are also harvests of salmon in the angling fishery in Labrador. In the angling fishery, in 1992 and 1993, a quota on the number of fish that could be retained was introduced. The quota was assigned for an entire SFA and was not administered on an individual river basis. Only hook-and-release fishing was permitted after the quota was caught. In 1994, quotas for the angling fishery were eliminated. In place of quotas, for Labrador, the season bag limit for retained salmon was lowered from eight to six fish, only two of which could be large salmon. In 1995 and 1996, the season bag limit for the angling fishery remained at six fish but only one large salmon could be retained. In 1999 and 2000, the angling fishery was restricted to a seasonal limit of four salmon retained, one of which could be large, and a daily limit of four salmon could be hooked-and-released. In 1999, use of barbless hooks became mandatory. In 2001, several additional rivers in southern Labrador crossed by the new Trans Labrador Highway were added to the list of scheduled rivers and restricted to individual bag limits of two small salmon retained.

The purpose of this paper is to document harvests of salmon in food and angling fisheries and to describe environmental conditions in Labrador in 2001.

## METHODS

## Angling fisheries

Catch and effort data from the angling fishery in northern (SFA 1) and southern Labrador (SFA 2) were collected by Department of Fisheries and Oceans (DFO) enforcement staff in conjunction with angling reports submitted by commercial sports camp operators and processed by DFO Science Branch (Fig. 1). Procedures for the collection and compilation of angling and commercial fishery data are described by Ash and O'Connell (1987). For purposes of separating 2SW salmon from 1SW salmon in angling fisheries, small salmon are defined as those salmon less than 63 cm and will be mainly 1SW (grilse) in age. Large salmon are those salmon equal to or greater than 63 cm and will be mainly 2SW and older in age.

In 1994, a new system, viz. the License Stub Return System (LSRS) was initiated for collecting angling statistics in Newfoundland and Labrador. It is based on attaching to the provincial angling licence a detachable stub upon which the angler can record details of where and when the fishing activity took place, and the numbers of salmon caught and released (O'Connell et al. 1998). Because of concerns over a lack of comparability of DFO angling statistics and the LSRS data, C\&P staff and camp operator data will continue to be used for Labrador in SFAs 1 \& 2. For SFA 14B rivers, the catch statistics for 1996-2000 were derived from the License Stub Return System. All 2001 year statistics are preliminary. Tags were issued to anglers that when attached to a salmon could be used to identify legally caught fish.

The Management Plan for the angling fishery in Labrador was as follows:
Season: 15 June to 15 September
Catch limits: four salmon per season, one of which can be large; except on Class III rivers where only two small salmon could be retained for the season

Hook \& release limits: four per day

## Food fisheries

In 2001, there were three food fisheries for salmon in Labrador: 1 - LIA (Labrador Inuit Association) food fishery in Lake Melville and in the northern Labrador coastal communities of Rigolet, Makkovik, Hopedale, Postville, and Nain; 2 - Innu Nation food fishery in Davis Inlet and in Lake Melville from the community of Sheshatshiu; and, 3 Labrador resident food fishery in Lake Melville and coastal communities in southern Labrador from Cartwright to Cape St. Charles. The LIA and Innu food fisheries were self-regulated by Aboriginal Fishery Guardians hired by these groups and the resident food fishery was regulated by DFO Fishery Officers and Guardian staff. For the LIA and resident food fisheries, tags for salmon were issued on an individual fisher basis to identify legally caught fish. Catch statistics were derived from logbooks issued to each fisher. The Innu Nation guardians collected catch statistics by maintaining a daily record of landings per family.

A summary of the year 2001 Management Plans for the three food fisheries as they pertain to salmon follows:

LIA
The Management Plan for the LIA food fishery was as follows:
Catch limits: up to ten salmon per licence, 10 tonnes of salmon for the season Season: May 22 to July 10 and July 24 to August 19 in Lake Melville and June 1 to September 30 for coastal communities, although dates may vary by community within these time frames.

INNU NATION
The guidelines for the Innu Nation food fishery were as follows:
Catch limits: thirty per household with a 1,500 community total for the season. Season: mid-June to end of $1^{\text {st }}$ week of August and mid-June to end of July for Sheshatshiu in Lake Melville.

## LABRADOR RESIDENT

Catch limits: four salmon per licence with a limit of 100 trout.
Season: July 15 to August 11 in southern Labrador, June 1 to July 1 and July 24 to 31 in Lake Melville and July 2 to August 31 in northern Labrador.

## Total returns to rivers

Total returns to rivers in Labrador are available for six river systems and one tributary. Total returns have been previously reported by Lowe \& Mullins (1996) for Forteau Brook and Mullins \& Caines (1998) for Pinware River (updated by Mullins, pers. comm.), by Reddin et al. (1996) for Sand Hill River, by Reddin \& Short (2000) for Big Brook, and by Reddin et al. (2000) for English River. Total returns to rivers include counts at counting fence traps plus downstream angling catches including estimates of hook and release mortalities, which are assessed at $10 \%$ of the number of salmon hooked and released.

## Environmental data

Environmental data consisting of water flow conditions are collected annually from a system of gauging stations set on various rivers which are operated by Environment Canada. Several of these stations have automated data collection platforms with provision for downloading data via satellite. The Province of Newfoundland and Labrador through the Department of Environment and Labour is responsible for downloading the data and provides it in near-real time; albeit with no quality control. Data are archived by Environment Canada after quality control and made available from the Environment Canada Hydat CD-Rom for the period of record up to and including 1997. The 2001 data from the Provincial system was used. Flow data from Alexis,

Eagle and Ugjoktok rivers were selected to be representative of conditions on Labrador salmon rivers in 2001.

## RESULTS \& DISCUSSION

## Angling fishery data

In SFA 1, the total catch (small and large salmon combined) of 1,238 decreased over 2000 by $16 \%$ (Table 1). In SFA 2, the total catch of 4,715 was $22 \%$ lower than in 2000 (Table 2). In SFA 14B, the total catch of 2,707 was similar to that of 2000 (Table 3). In 2001, the total Labrador angling catch in all SFAs was 9,222 salmon including hooked and released fish which was $16 \%$ lower than levels experienced in 2000 but remained higher than in previous years (Table 4). The catch of small salmon was 7,330 (1,929 retained and 5,401 released) and large salmon was 1,892 (326 retained and 1,566 released). The proportion of salmon released by anglers in Labrador, which has been increasing over time, was $76 \%$ of the total catch, and was the highest value reported to date. In total, there were 6,967 small and large salmon reported to have been hooked and released in 2001 (Tables 1-4).

## Food fisheries data

In 2001, the following preliminary landings of salmon were reported for the food fisheries in Labrador:

|  | Small salmon |  | Large salmon |  | Total |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number | Weight (kg) | Number | Weight (kg) | Number | Weight (kg) |
| Northern Labrador \& Lake MeIville (SFA 1) |  |  |  |  |  |  |
| LIA |  |  |  |  |  |  |
| Innu | 2,573 | 686 | 1,227 | 1,134 | 4,446 | 3,707 |
| Resident | 135 | 288 | 138 | 553 | 840 | 2,073 |
| Total | 3,394 | 6,995 | 1,299 | 123 | 161 | 411 |
| Southern Labrador (SFA 2) | 5,121 | 4,708 | 12,117 |  |  |  |
| Resident | 1,396 | 2,793 | 374 | 1,378 | 1,770 | 4,172 |
| TOTAL | 4,789 | 9,789 | 1,673 | 6,499 | 6,478 | 16,288 |

In total, there were about 6,500 salmon reported by food fisheries in Labrador with a total weight of $16,290 \mathrm{~kg}$, which is an increase of almost 700 kg over 2000 . This increase was largely due to a small increase in the proportion of large salmon in the landings, which are heavier. Reporting rates for the various fisheries were $100 \%$ for the Innu Nation food fishery in Sheshatshiu, $71 \%$ for the LIA food fishery and $79 \%$ for the resident food fishery.

In 2001, preliminary landing information is also available for charr and trout from the Resident Food Fishery:

|  | Charr |  | Trout |  |
| :--- | :---: | :---: | :---: | :---: |
| SFA | Number | Weight (kg) | Number | Weight (kg) |
|  |  |  |  |  |
| $\mathbf{1}$ | 76 | 92 | 3,489 | 2,433 |
| $\mathbf{2}$ | 5,147 | 5,157 | 10,467 | 7,648 |
| Total | 5,223 | 5,248 | 13,956 | 10,080 |

In total, there were 5,223 charr and 13,956 brook trout landed in the resident food fishery in Lake Melville (SFA 1) and southern Labrador (SFA 2). The response rate for the logbooks was $79 \%$. The total numbers of charr and trout landed in Labrador are unknown as there is no reporting system for fish caught either through the ice in the winter/spring or by recreational fishing in summer.

## Total returns to rivers

Total returns of small and large salmon are listed in Table 5 for those years of available data. On the rivers with time series information, declines were observed for small and large salmon on Forteau Brook (1994-97), increasing small salmon for Sand Hill River (1970-73 \& 1994-96) and increasing trends for small salmon at Southwest Brook (Paradise River, 1998-99), while large salmon declined on Sand Hill River and Southwest Brook. In 2001, small and large salmon decreased on Southwest Brook compared to counts in 1998-99, but in the presence of the Resident Food Fishery, while at English River (1999-2001), counts of small salmon declined over 2000 while large salmon increased.

## Environmental data

Daily water flows on Alexis River at the June 1 in 2001 were lower than mean and maximum flows, dropping quickly to slightly above minimum flows except for a sharp increase in mid-July. During August and September, water flow was below average but mainly above minimum values (Fig. 2). Daily water flows on Eagle River in 2001 were about average on the June 1 declining below average but remaining above minimum flows until about July 15 when they increased sharply to above average, remaining so until the end of August, after which they declined to below the average (Fig. 3). Daily flow conditions on Ugjotok River in 2001 were below average on June 15 and remained below average for much of the summer, increasing to above average for some of August and September (Fig. 4).

## Salmon Rivers in Labrador

Anderson (1985) lists 120 rivers in Labrador from the southern border with Quebec to Cape Chidley. A summary is provided here along with estimates of rearing and drainage areas for all salmon rivers in Labrador including some omitted by Anderson (1985). There are some rivers that were left out of this list, i.e. Port Marnham Brook, Barge Bay Brook, and Southwest Tributary of White Bear River. Of these, there
currently are about 81 rivers with salmon that have a drainage area bigger than about $50 \mathrm{~km}^{2}$. Some of these rivers have only salmon in them whereas others have a mix of brook trout and Arctic charr. The survey information from these rivers are detailed in Table 6.

## ACKNOWLEDGEMENTS

The assistance of the staff of DFO Goose Bay, DFO Fisheries Officers and Guardians, and Aboriginal Guardians and staff is gratefully acknowledged. Mr. C. Baker from Environment Canada provided the Ugjoktok River flow data.

IN THE ABOVE TABLE A PERIOD INDICATES NO DATA FOR THAT YEAR.
CPUE IS BASED ON RETAINED + RELEASED FISH FOR 1992-95 AND ON RETAINED FISH ONLY PRIOR TO 1992.
*NOT ALLOWED TO RETAIN LARGE SALMON IN SFA 14B, 1997-2001.
**DATA OBTAINED FROM THE LICENSE STUB RETURN (2001 DATA ARE PRELIMINARY).

Table 5. Summary of total returns to rivers in Labrador. Total returns include angling catches below counting facilities plus count from counting fence or mark-recapture population estimate.

| Year | Forteau Brook |  | Pinware River |  | Sand Hill River |  | Paradise River \& Southwest Brook |  |  |  | Big Brook |  | English River |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 6. Dtairage areas, fact tabitat and potential adult production for Labrador civers (Anderson 1985). Drairage area and trabitat measured lsing 1:250 000 scale mafs. Numbers in bold type are estimated from SFA totals. (1) indicates that draimge basin thas been ce-surveyed and is different than in Anderson (1985) Rivers in bold italics tave angling data for some years but not necessarily all years.

| No. | River | SFA | Region | TotalWatershed Drainage (kra2) |  | Parr rearing habitat |  | Potential adult production | Comments |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
