#### Abstract

This paper summarizes information on angling and food fisheries catch statistics for Labrador in 2002 along with environmental data collected at gauging stations on selected rivers. Total return information was summarised from counting facilities. Food fisheries in Labrador recorded landings of 7,236 Atlantic salmon weighing 17,551 kg. Landings recorded by the angling fishery were 1,815 small salmon retained, 5,057 small salmon released, 202 large salmon retained and 1,084 large salmon released. In general, water levels in Labrador rivers were near average in the spring and low to average throughout most of the summer. Low water continued well into the fall.

## RÉSUMÉ

Ce document présente un résumé des statistiques sur les prises des pêches sportives et des pêches de subsistance pratiquées au Labrador en 2002, ainsi que des données sur les conditions environnementales recueillies à des stations hydrométriques installées dans certaines rivières. Les renseignements sur les remontes totales proviennent des barrières de dénombrement. Les pêcheurs de subsistance ont capturé 7236 saumons atlantiques, pesant au total 17551 kg , tandis que les pêcheurs sportifs ont gardé 1815 petits saumons et 202 gros saumons et relâché 5057 petits saumons et 1084 gros saumons. En général, les niveaux d'eau dans les rivières du Labrador s'approchaient de la moyenne au printemps, mais étaient faibles à moyens pendant presque tout l'été. L'eau est restée à de faibles niveaux jusque tard à l'automne.

## INTRODUCTION

In 1992, several major changes were introduced to the management of Atlantic salmon (Salmo salar L.) in Newfoundland and Labrador. A five-year moratorium was placed on commercial salmon fishing in the island portion of the province, quotas for the Labrador commercial fishery, first introduced in 1990, were further reduced and a voluntary retirement of commercial salmon licences was instituted for all of the province. Beginning in 1997, the commercial fishery was closed in the Straits area of Labrador in Salmon Fishing Area (SFA) 14B and then in 1998, it was closed in the remaining SFAs $1 \& 2$ (Fig. 1). Fishers were offered a buyout which most accepted. In 1999-2001, a food fishery of 10 tonnes was available for members of the Labrador Inuit Association including Lake Melville, which is also in SFA 1. The Innu Nation fishes for salmon in Lake Melville and from the community of Davis Inlet and generally restrict themselves to harvests of around three tonnes. Beginning in 2000 and continuing into 2001, residents of Labrador were allowed to fish in the sea for brook trout (Salvelinus fontinalis Mitchill) and Arctic charr (Salvelinus alpinus L.) with a permitted bycatch of four salmon. The west Greenland commercial salmon fishery, which was closed for the 1993 and 1994 fishing seasons, was re-opened in 1995 and closed again in 1999, leaving only a small subsistence food fishery in 2000. In 2001, the commercial Greenland fishery was opened with a structured quota system that depended on abundance based on in-season catches and historical averages to determine potential landings. Although there have been no recent tagging studies to document the distribution of Labrador salmon at sea, some Labrador origin multi-sea winter salmon may be caught in the Greenland fishery similar to what was shown for Labrador stocks in earlier studies by Pratt et al. (1974).

There are also harvests of salmon in the angling fishery in Labrador. In 1992 and 1993, a quota on the number of fish that could be retained was introduced. The quota was assigned for an entire SFA and was not administered on an individual river basis. Only hook-and-release fishing was permitted after the quota was caught. In 1994, quotas for the angling fishery were eliminated. In place of quotas, for Labrador, the season bag limit for retained salmon was lowered from eight to six fish, only two of which could be large salmon. In 1995 and 1996, the season bag limit for the angling fishery remained at six fish but only one large salmon could be retained. In 1999 and 2000, the angling fishery was restricted to a seasonal limit of four salmon retained, one of which could be large, and a daily limit of four salmon could be hooked-andreleased. In 1999, use of barbless hooks became mandatory. In 2001, as part of a 2001-2005 Management Plan, several additional rivers in southern Labrador crossed by the new Trans Labrador Highway were added to the list of scheduled rivers and restricted to individual bag limits of two small salmon retained. The Management Plan remained the same in 2002 as in 2001.

The purpose of this paper is to document harvests of salmon in food and angling fisheries and to describe environmental conditions in Labrador in 2002.

## METHODS

## Angling fisheries

Catch and effort data from the angling fishery in northern (SFA 1) and southern Labrador (SFA 2) were collected by Department of Fisheries and Oceans (DFO) enforcement staff in conjunction with angling reports submitted by commercial sports camp operators and processed by DFO Science Branch (Fig. 1). Procedures for the collection and compilation of angling and commercial fishery data are described by Ash and O'Connell (1987). For purposes of separating 2SW salmon from 1SW salmon in angling fisheries, small salmon are defined as those salmon less than 63 cm and will be mainly 1SW (grilse) in age. Large salmon are those salmon equal to or greater than 63 cm and will be mainly 2 SW and older in age.

In 1994, a new system, viz. the License Stub Return System (LSRS) was initiated for collecting angling statistics in Newfoundland and Labrador. It is based on attaching to the provincial angling licence a detachable stub upon which the angler can record details of where and when the fishing activity took place, and the numbers of salmon caught and released (O'Connell et al. 1998). Because of concerns over a lack of comparability of DFO angling statistics and the LSRS data, C\&P staff and camp operator data will continue to be used for Labrador in SFAs $1 \& 2$. For SFA 14B rivers, the catch statistics for 1996-2002 were derived from the License Stub Return System. All 2002 year statistics are preliminary. Tags were issued to anglers that when attached to a salmon could be used to identify legally caught fish.

The Management Plan for the angling fishery in Labrador was as follows:
Season: 15 June to 15 September
Catch limits: four salmon per season, one of which can be large; except on Class III rivers where only two small salmon could be retained for the season

Hook \& release limits: four per day

## Food fisheries

In 2002, there were three food fisheries for salmon in Labrador: 1 - LIA (Labrador Inuit Association) food fishery in Lake Melville and in the northern Labrador coastal communities of Rigolet, Makkovik, Hopedale, Postville, and Nain; 2 - Innu Nation food fishery in Davis Inlet and in Lake Melville from the community of Sheshatshiu; and, 3 - Labrador resident food fishery in Lake Melville and coastal communities in southern Labrador from Cartwright to Cape St. Charles. The LIA and Innu food fisheries were self-regulated by Aboriginal Fishery Guardians hired by these groups and the resident food fishery was regulated by DFO Fishery Officers and Guardian staff. For the LIA and resident food fisheries, tags for salmon were issued on an individual fisher basis to identify legally caught fish. Catch statistics were derived from logbooks issued to each fisher. The Innu Nation guardians collected catch statistics by maintaining a daily record of landings per family.

A summary of the year 2002 Management Plans for the three food fisheries as they pertain to salmon follows:

LIA

The Management Plan for the LIA food fishery was as follows:
Catch limits: up to ten salmon per licence, 10 tonnes of salmon for the season Season: May 22 to July 10 and July 24 to August 19 in Lake Melville and June 1 to September 30 for coastal communities, although dates may vary by community within these time frames.

INNU NATION
The guidelines for the Innu Nation food fishery were as follows:
Catch limits: thirty per household with a 1,500 community total for the season. Season: mid-June to end of $1^{\text {st }}$ week of August and mid-June to end of July for Sheshatshiu in Lake Melville.

## LABRADOR RESIDENT

The Management Plan for the Labrador Resident food fishery was as follows:
Catch limits: four salmon per licence with a limit of 100 trout.
Season: July 15 to August 11 in southern Labrador, June 1 to July 1 and July 24 to 31 in Lake Melville and July 2 to August 31 in northern Labrador.

## Total returns to rivers

Total returns to rivers in Labrador are available for six river systems and one tributary. Total returns have been previously reported by Lowe \& Mullins (1996) for Forteau Brook and Mullins \& Caines (1998) for Pinware River (updated by Mullins, pers. comm.), by Reddin et al. (1996) for Sand Hill River, by Reddin \& Short (2000) for Big Brook, and by Reddin et al. (2000) for English River. In 2001, there was a counting fence in operation on Muddy Bay Brook (Dykes River) for the first time. Total returns to rivers include counts at counting fence traps plus downstream angling catches including estimates of hook and release mortalities, which are assessed at $10 \%$ of the number of salmon hooked and released.

## Environmental data

Environmental data consisting of water flow conditions are collected annually from a system of gauging stations set on various rivers which are operated by Environment Canada. Several of these stations have automated data collection platforms with provision for downloading data via satellite. The Province of Newfoundland and Labrador through the Department of Environment and Labour is responsible for downloading the data and provides it in near-real time; albeit with no quality control. Data are archived by Environment Canada after quality control and made
available from the Environment Canada Hydat CD-Rom for the period of record up to and including 1997. Flow data from Alexis, Eagle and Ugjoktok rivers were selected to be representative of conditions on Labrador salmon rivers in 2002.

## RESULTS \& DISCUSSION

## Angling fishery data

In SFA 1, the total catch (small and large salmon combined) of 779 decreased over 2001 by $37 \%$ (Table 1). In SFA 2, the total catch of 4,432 was $6 \%$ lower than in 2001 (Table 2). In SFA 14B, the total catch of 2,947 was $33.2 \%$ higher than in 2001 (Table 3). In 2002, the total Labrador angling catch in all SFAs was 8,158 salmon including hooked and released fish which was $2.9 \%$ higher than levels experienced in 2001 but remained higher than in previous years excluding 2000 with a total catch of 11,128 (Table 4). The catch of small salmon was $6,872(1,815$ retained and 5,057 released) and large salmon was 1,286 ( 202 retained and 1,084 released). The proportion of salmon released by anglers in Labrador, which has been increasing over time, was $75.3 \%$ of the total catch. In total, there were 6,141 small and large salmon reported to have been hooked and released in 2002 (Tables 1-4).

## Food fisheries data

In 2002, the following preliminary landings of salmon were reported for the food fisheries in Labrador:

|  | Small salmon |  | Large salmon |  | Total |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number | Weight (kg) | Number | Weight (kg) | Number | Weight (kg) |
| Northern Labrador \& Lake Melville (SFA 1) |  |  |  |  |  |  |
| LIA | 3,248 | 6,665 | 886 | 3,808 | 4,135 | 10,473 |
| Innu | 209 | 412 | 104 | 540 | 306 | 931 |
| Resident | 152 | 309 | 24 | 93 | 176 | 402 |
| Total | 3,609 | 7,386 | 1,014 | 4,441 | 4,617 | 11,806 |
| Southern Labrador (SFA 2) |  |  |  |  |  |  |
| Resident | 2,197 | 4,196 | 422 | 4,196 | 2,619 | 5,745 |
| TOTAL | 5,806 | 11,582 | 1,436 | 8,637 | 7,236 | 17,551 |

In total, there were about 7,200 salmon reported by food fisheries in Labrador with a total weight of $17,550 \mathrm{~kg}$, which is an increase of almost $1,260 \mathrm{~kg}$ over 2001. This increase was due to higher catches in the resident fishery in 2002. Reporting rates for the various fisheries were $98 \%$ for the Innu Nation food fishery in Sheshatshiu, $82 \%$ for the LIA food fishery in Lake Melville and northern Labrador and $84 \%$ for the resident food fishery in Lake Melville and southern Labrador.

In 2002, preliminary landing information is also available for charr and trout from the Resident, LIA and Innu Food Fisheries:

|  | Charr |  | Trout |  |
| :--- | :---: | :---: | :---: | :---: |
| SFA | Number | Weight (kg) | Number | Weight (kg) |
|  |  |  |  |  |
| $\mathbf{1}$ | 7,175 | 13,442 | 10,567 | 9,816 |
| $\mathbf{2}$ | 7,126 | 6,994 | 10,861 | 8,774 |
| Total | 14,301 | 20,436 | 21,428 | 18,590 |

In total, there were 14,301 charr and 21,428 brook trout reported landed in the food fisheries in Lake Melville (SFA 1), northern (SFA 1) and southern Labrador (SFA 2) in 2002 during the open water fishing season. The total numbers of charr and trout landed in Labrador are unknown as there is no reporting system for fish caught either through the ice in the winter/spring or by recreational fishing in summer.

## Total returns to rivers

Total returns of small and large salmon are listed in Table 5 for those years of available data. On the rivers with time series information, declines were observed for small and large salmon on Forteau Brook (1994-97), increasing small salmon for Sand Hill River (1970-73 \& 1994-96) and increasing trends for small salmon at Southwest Brook (Paradise River, 1998-99), while large salmon declined on Sand Hill River and Southwest Brook. In 2001, small and large salmon decreased on Southwest Brook compared to counts in 1998-99, but in the presence of the Resident Food Fishery, while at English River (1999-2001), counts of small salmon declined over 2000 while large salmon increased. In 2002, the number of small salmon decreased, while the number of large salmon increased at Sand Hill River and Southwest Brook. There was 106 small salmon and 11 large salmon at Muddy Bay Brook. The number of small and large salmon decreased at the English River.

## Environmental data

Daily water flow rates on Alexis River at the beginning of June in 2002 were lower than maximum but higher than the mean flow, dropping quickly to slightly above minimum flows except for an increase above average flows in mid-July and another in mid-August. In September, the water flow was similar to the mean flow until mid and near the end of September when water flows rose to near maximum flow rates. The water flow rate then decreased to slightly below the mean flow rate at the end of September (Fig. 2). On June 1, daily water flows on Eagle River in 2002 were above the mean but below the maximum water flow rate. The water flow rates continued to decline to below average for the month of June but remained above minimum flows. The water flows continued to remain above minimum values and mainly below the average for the month of July. During August and September water flows were similar to mean water flows (Fig. 3). On June 1, daily flow conditions on Ugjoktok River in 2002 increased to near maximum flows. From mid-June to mid-July water flow rates were similar to or above maximum flows and then declined to the mean flow rate by the first week in August where it remained for the rest of August and September (Fig. 4).

## Salmon Rivers in Labrador

Anderson (1985) lists 120 rivers in Labrador from the southern border with Quebec to Cape Chidley. A summary is provided here along with estimates of rearing and drainage areas for all salmon rivers in Labrador including some omitted by Anderson (1985). There are some rivers that were left out of this list, i.e. Port Marnham Brook, Barge Bay Brook, and Southwest Tributary of White Bear River. Of these, there currently are about 81 rivers with salmon that have a drainage area bigger than about $50 \mathrm{~km}^{2}$. Some of these rivers have only salmon in them whereas others have a mix of brook trout and Arctic charr. The survey information from these rivers if available are detailed in Table 6.

## ACKNOWLEDGEMENTS

The assistance of the staff of DFO Goose Bay, DFO Fisheries Officers and Guardians, and Aboriginal Guardians and staff is gratefully acknowledged. Mr. C. Baker from Environment Canada provided the Ugjoktok River flow data.

IN THE ABOVE TABLE A PERIOD INDICATES NO DATA FOR THAT YEAR.
CPUE IS BASED ON RETAINED + RELEASED FISH FOR 1992-2002 AND ON RETAINED FISH ONLY PRIOR TO 1992.
1996-2002 DATA ARE A COMBINATION OF LICENSE STUB RETURN (SFA 14B)AND RIVER GUARDIAN (SFA's $1 \& 2$ ) METHODS. 2002 DATA ARE PRELIMINARY.

Table 5. Summary of total returns to rivers in Labrador. Total returns include angling catches below counting facilities plus count from counting fence or mark-recapture population estimate.

Table 6. Draimge aceas, part trabitat and potertial adult production for Labrador civers (Anderson 1985). Draimge area and trabitat measured lsing 1:250 000 scale mafs Numbers in bold type are estimated from SFA totals. (1) indicates that draimge basin tas been re-surveyed and is different than in Anderson (1985). Rivers in bold italics tave angling data for some years but not recessarily all years.
