This series documents the scientific basis for the evaluation of aquatic resources and ecosystems in Canada. As such, it addresses the issues of the day in the time frames required and the documents it contains are not intended as definitive statements on the subjects addressed but rather as progress reports on ongoing investigations.

Research documents are produced in the official language in which they are provided to the Secretariat.

This document is available on the Internet at:

<http://www.dfo-mpo.gc.ca/csas/>

La présente série documente les fondements scientifiques des évaluations des ressources et des écosystèmes aquatiques du Canada. Elle traite des problèmes courants selon les échéanciers dictés. Les documents qu'elle contient ne doivent pas être considérés comme des énoncés définitifs sur les sujets traités, mais plutôt comme des rapports d'étape sur les études en cours.

Les documents de recherche sont publiés dans la langue officielle utilisée dans le manuscrit envoyé au Secrétariat.

Ce document est disponible sur l'Internet à:

Siferd, T. 2010. By-catch in the shrimp fishery from Shrimp Fishing Areas 0-3, 1979 to 2009. DFO Can. Sci. Advis. Sec. Res. Doc. 2010/037. vi + 77 p.

ABSTRACT

A summary of by-catch data from the shrimp fishery conducted in Shrimp Fishing Areas (SFAs) 0-3 in northern Canada is presented. By-catch summary weight data, recorded by observers for the four management areas are presented for years where data were available from 1979 to 2009. Data for commercial fish species, Greenland Halibut (*Reinhardtius hippoglossoides*), Redfish (*Sebastes spp.*), Atlantic Cod (*Gadus morhua*) and American Plaice (*Hippoglossoides platessoides*) and those marine fishes currently listed under the Species at Risk Act (SARA), Northern Wolffish (*Anarhichas denticulatus*), Spotted Wolffish (*Anarhichas minor*), and Striped Wolffish (*Anarhichas lupus*), includes measured by-catch data from Observer records. These data are only complete to the 2007/08 management year. The total number of each of these species caught is estimated for those years when measurement data were collected.

RÉSUMÉ

Le présent document résume les données sur les prises accessoires de la pêche à la crevette pratiquée dans les zones de pêche à la crevette (ZPC) 0-3, dans le nord du Canada. Les données sommaires sur le poids des prises accessoires fournies par des observateurs dans les quatre zones de gestion sont présentées pour les années où des données sont disponibles de 1979 à 2009. Les données sur des espèces exploitées commercialement, notamment le flétan du Groenland (*Reinhardtius hippoglossoides*), le sébaste (*Sebastes spp.*), la morue (*Gadus morhua*) et la plie canadienne (*Hippoglossoides platessoides*) ainsi que sur des poissons marins inscrits à la liste de la Loi sur les espèces en péril (LEP), comme le loup à tête large (*Anarhichas denticulatus*), le loup tacheté (*Anarhichas minor*) et le loup atlantique (*Anarhichas lupus*), comprennent des mesures sur les prises accessoires provenant des registres des observateurs. Ces données ne sont complètes que pour l'année de gestion 2007-2008. On a estimé le nombre total de prises pour chaque espèce pour les années où des mesures ont été prises.

INTRODUCTION

Shrimp fishing in northern Canada (Shrimp Fishing Areas (SFA) 0-3; Fig. 1) began in the late 1970s in SFA1, expanding to SFA3 and finally to SFA2 and in particular SFA2 commercial where the majority of shrimp in the north are now caught. Foreign vessels were allowed to fish in Canadian water at the start of the fishery but it is now conducted only by the Canadian flagged large vessel fleet (LOA>100', >500t). The fleet currently consists of approximately 10 vessels fishing the allocations of the 17 license holders. SFAs 0 and 1 fisheries are based on a calendar year from January 1 to December 31 while SFAs 2 and 3 are conducted on a fiscal year running from April 1 to March 31. The policy change from a calendar year to fiscal year in SFAs 2 and 3 was implemented in 2003, so the management year 2003/04 was actually 15 months long.

Shrimp fishing is conducted with bottom trawl gear. The high volume of catch of non-targeted species was a major management concern with this type of bottom contact fishery. The Nordmore grate, a by-catch excluder device, was introduced in 1993 to the Canadian shrimp industry. The Nordmore grate filters the catch entering the trawl allowing animals larger than the grate size to escape through an opening in the top of the net. The grate proved effective in significantly reducing the by-catch while maintaining the catch rate of shrimp. In 1997, the Nordmore grate with a bar spacing of 28 mm was made mandatory in all SFAs in northern Canada.

This report summarizes the by-catch occurring in the northern shrimp fishery as recorded by the fisheries observer program from the start of the fishery in the north to the 2008/09 management year. All vessels in the fleet fishing the north are required to have an observer on board so data coverage is complete.

METHODS

Observers, required as a condition of license for all vessels in this fishery, provide data on the total catch weights of each by-catch species. The observer database reports the weight of both the directed species and any by-catch for each set taken. These data reported here were tallied from the observer database on a management year basis. Records were assigned to a particular SFA through the recorded tow location. Errors in position are known to occur in the observer records which have not been fully corrected. While the actual error rate is unknown, it is thought to be low.

During a trip, the observer randomly selects sets for more detailed analysis of groundfish species of particular interest which include, Greenland Halibut (*Reinhardtius hippoglossoides*), Redfish (*Sebastes* spp.), Atlantic Cod (*Gadus morhua*) and American Plaice (*Hippoglossoides platessoides*) and those marine fishes currently listed under the Species at Risk Act (SARA), Northern Wolffish (*Anarhichas denticulatus*), Spotted Wolffish (*Anarhichas minor*), and Striped Wolffish (*Anarhichas lupus*). Lengths of these species are recorded as well as the weight of the sample taken for measurement. Weight is recorded to 1 kg precision, length to 1 cm. To estimate the overall numbers captured by the fishery, the total weight of the species collected in a management year was divided by the total weight of samples taken from the set to be measured. This ratio was used to extrapolate the observer length-frequency distribution to an overall estimate of the number of fish actually capture in the management year. Only years where measured samples were recorded in the database are reported. The species may have been caught in other years but no attempt was made to estimate the number caught.

RESULTS AND DISCUSSION

By-catch for all management years with data are reported for SFA0 (Table 1), SFA1 (Table 2), SFA2 (Table 8) and SFA3 (Tables 13). By-catch relative to total catch is low in the main shrimp fishery areas but varies by SFA. SFA0 had the highest average by-catch at 69.2% over the 12 years recorded from 1985 to 2005 (Table 1). This is a high rate but SFA0 is an exploratory area and of limited commercial interest. Few sets (72 over all years) and low shrimp catch results in the high by-catch rate. The low effort in SFA0 makes the high rate of little concern. SFA1 had an average by-catch of 3.5% over the period 1999-2007 (Table 2). This is in contrast to the over five times higher rate of 18.4% in 1979-1989 prior to the use of the Nordmore grate. SFA2 had the lowest average by-catch rate at 1.7% for 1999-2008/09, a marked improvement to the 31.8% at the start of the fishery 1979-1989 (Table 8). Average by-catch in SFA3 from 1999-2008/09 was 4.2% while the pre-grate average for 1979-1989 in SFA3 was 11.5 (Table 13). While the by-catch rates in SFA 1-3 is low, these rates are likely overestimated because of the minimum 1 kg weight precision used in recording the data.

Set locations for SFA1 (1997-2008) are shown in Figure 2. Figures 3-9 plot set locations for each of the species with more detailed length data. Unfortunately no length measurement data exists prior to the implementation of the Nordmore grate. Therefore it is not possible to judge the impact the grate has on the size of the fish caught. In SFA1, length-frequency of Greenland Halibut (Table 3, Fig.3), Redfish (Table 4, Fig. 4), Atlantic Cod (Table 5, Fig. 5), American Plaice (Table 6, Fig. 6), Northern Wolffish (Table 7, Fig. 7), Spotted Wolffish (Table 7, Fig. 8) and Striped Wolffish (Table 7, Fig. 9) are reported and include estimates of the number of individuals removed from the area.

Set locations for SFA2 (1997-2008) are shown in Figure 10. Figures 11-17 plot set locations for individual species. In SFA2, length-frequency data and estimates of number of individual Greenland Halibut (Table 9, Fig. 11), Redfish (Table 10, Fig. 12), Atlantic Cod (Table 11, Fig. 13), American Plaice (Table 11, Fig. 14), Northern Wolffish (Table 12, Fig. 15), Spotted Wolffish (Table 12, Fig. 16) and Striped Wolffish (Table 12, Fig. 17) are provided. No measured sets exist for SFA0 and one for SFA3 so they were not included.

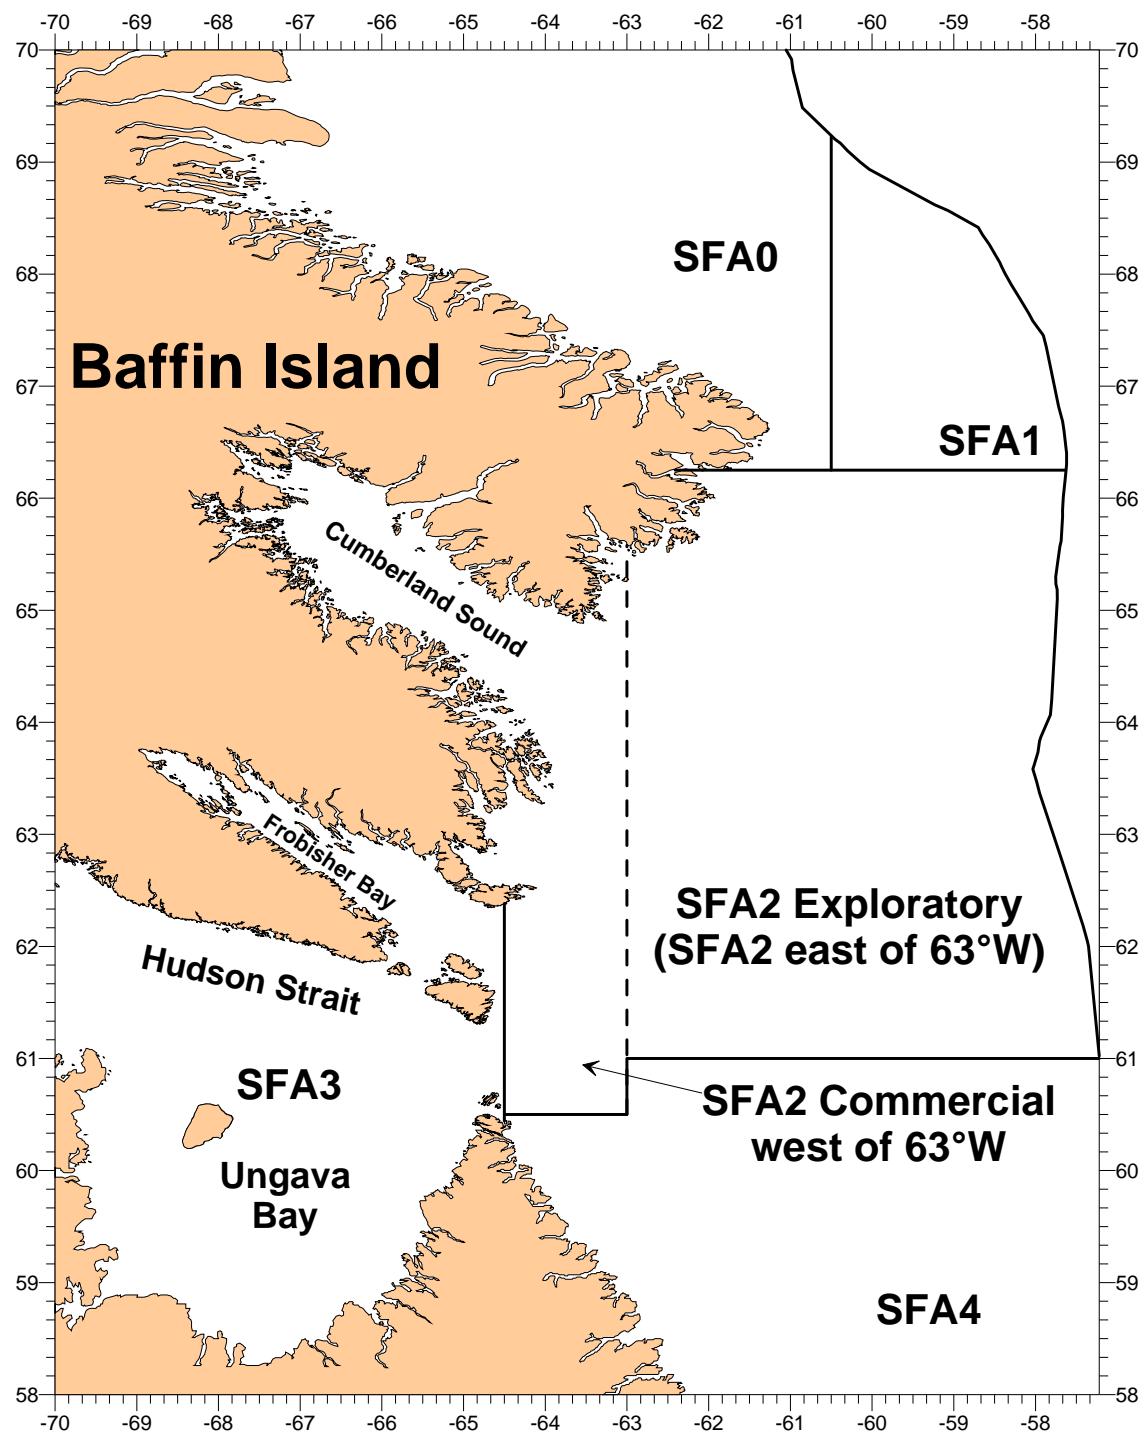

Figure 1. Shrimp Fishing Areas defined for the reporting of catch and management of the shrimp fishery in the Canadian north within the Central and Arctic region of Fisheries and Oceans Canada.

Table 1. Shrimp Fishing Area 0 - by-catch from the shrimp fishery for all years with records included in the Observer database. Missing years indicate that no fishing occurred in the area that year.
