Canadian Manuscript Report of Fisheries and Aquatic Sciences

Manuscript reports contain scientific and technical information that contributes to existing knowledge but which deals with national or regional problems. Distribution is restricted to institutions or individuals located in particular regions of Canada. However, no restriction is placed on subject matter, and the series reflects the broad interests and policies of Fisheries and Oceans Canada, namely, fisheries and aquatic sciences.

Manuscript reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in the data base *Aquatic Sciences and Fisheries Abstracts*.

Manuscript reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page.

Numbers 1-900 in this series were issued as Manuscript Reports (Biological Series) of the Biological Board of Canada, and subsequent to 1937 when the name of the Board was changed by Act of Parliament, as Manuscript Reports (Biological Series) of the Fisheries Research Board of Canada. Numbers 1426 - 1550 were issued as Department of Fisheries and Environment, Fisheries and Marine Service Manuscript Reports. The current series name was changed with report number 1551.

Rapport manuscrit canadien des sciences halieutiques et aquatiques

Les rapports manuscrits contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais qui traitent de problèmes nationaux ou régionaux. La distribution en est limitée aux organismes et aux personnes de régions particulières du Canada. Il n'y a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques de Pêches et Océans Canada, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports manuscrits peuvent être cités comme des publications à part entière. Le titre exact figure au-dessus du résumé de chaque rapport. Les rapports manuscrits sont résumés dans la base de données *Résumés des sciences aquatiques et halieutiques*.

Les rapports manuscrits sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre.

Les numéros 1 à 900 de cette série ont été publiés à titre de Manuscrits (série biologique) de l'Office de biologie du Canada, et après le changement de la désignation de cet organisme par décret du Parlement, en 1937, ont été classés comme Manuscrits (série biologique) de l'Office des recherches sur les pêcheries du Canada. Les numéros 901 à 1425 ont été publiés à titre de Rapports manuscrits de l'Office des recherches sur les pêcheries du Canada. Les numéros 1426 à 1550 sont parus à titre de Rapports manuscrits du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 1551.

ABSTRACT

Kenchington, E., Lurette, C. and De Clippele, L.H. 2021. Cruise Report in Support of Maritimes Region Research Project: Use of Passive Acoustics to Quantify Fish Biodiversity and Habitat Use. Can. Manuscr. Rep. Fish. Aquat. Sci. 3231: iv + 52 p.

The Department of Fisheries and Oceans in collaboration with the University of Edinburgh and the Ocean Tracking Network successfully deployed three benthic landers in the Sambro Bank Sponge Conservation Area. These landers are equipped with camera systems and passive acoustic receivers to record the soundscape on the *Vazella pourtalesii* sponge grounds. This document provides the necessary background information for the mission (HUDSON2021-048) which also completed three associated CTD casts and a number of photo transects using a drop camera system (4K Camera) to characterize the benthic habitats.

RÉSUMÉ

Kenchington, E., Lurette, C. and De Clippele, L.H. 2021. Cruise Report in Support of Maritimes Region Research Project: Use of Passive Acoustics to Quantify Fish Biodiversity and Habitat Use. Can. Manuscr. Rep. Fish. Aquat. Sci. 3231: iv + 52 p.

Pêches et Océans Canada, en collaboration avec l'Université d'Édimbourg et Ocean Tracking Network, a déployé trois sondes en milieu benthique dans la zone de conservation des éponges du banc Sambro. Ces sondes sont équipées de caméras et de récepteurs acoustiques passifs pour enregistrer le paysage sonore des récifs d'éponges *Vazella pourtalesii*. Ce document présente le contexte nécessaire pour la mission (HUDSON2021-048), pendant laquelle on a aussi déployé trois sondes de conductivité, de température et de profondeur de même que plusieurs transects de photos à l'aide d'un système de caméra lestée (Caméra 4K) afin de caractériser les habitats benthiques.

HUDSON2021-048 MISSION DETAILS

The Commanding Officer for the CCGS *Hudson* mission (Hudson2021-048) was Captain Fergus Francey of the Canadian Coast Guard. Captain Francey and his crew were instrumental to the success of this mission. CCGS *Hudson* was originally scheduled to run from 9-13 September, 2021, however, the region was hit by a Category 3 major hurricane, Larry (Figure 1), which delayed departure until 11 September, 2021. The hurricane first formed on the 31st of August and dissipated by the 13th of September, being designated an extratropical cyclone after the 11th of September. The highest winds reached 205 km/h and produced significant swells. Nevertheless, the CCGS *Hudson* mission successfully completed 15 operations: 9 4K Camera transects, 3 CTD casts and 3 lander deployments. These operations completed the core activities planned for the mission, and one of the additional planned 4K Camera transects was completed in a previously assessed area. Details of those operations are provided in this report, and the Cruise Planning Document completed prior to sailing, which outlines the objectives of the mission in detail, is summarized in Appendix 1. A Navigation Warning was prepared and posted to warn of the mooring locations even though they are in an area closed to bottom-contact fishing (Appendix 2).

This research project is registered in the DFO DMAApps under Project 835 (Ocean Ecology Section, Ecosystem Assessment, Benthic Biodiversity and Ecology) and was approved by DFO management. The end date of the project is 29 March 2024. The project is a collaboration between DFO, the University of Edinburgh, the Ocean Tracking Network (OTN) and the iAtlantic project. The iAtlantic project is funded by the European Union's Horizon 2020 research and innovation programme under Grant Agreement no. 818123, and is an accepted project under the United Nations Ocean Decade initiative.

Scientific Cruise Participants

This mission involved at-sea participation of 11 scientists (Table 1). All but one of the participants were employees of Fisheries and Oceans, Canada (DFO) at the time of sailing. The DFO team was joined by Dr. Laurence De Clippele of the University of Edinburgh who is a principle investigator on the research project.

Table 1. Cruise participants and responsibilities.

Name (Affiliation)	Duty
1. Kenchington, Ellen (DFO)	Chief Scientist
2. Lurette, Camille (DFO)	Data Manager
3. MacDonald, Barry (DFO)	Operational Lead, 4K Cam, Lander Cameras and fittings, CTD
4. Xu, Jinshan (DFO)	Lander Operational Lead
5. De Clippele, Laurence (Edinburgh)	Lander Deployment, 4K Cam
6. Barthelette, Jay (DFO)	Lander Deployment
7. Theriault, Christiane (DFO)	Lander Deployment
8. Bouchard Marmen, Marieve (DFO)	4K Cam operation, CTD
9. Murillo, Francisco Javier (DFO)	4K Cam operation, CTD
10. Staniforth, Calisa (DFO)	Science Support, marine mammals
11. Odenthal, Brighid (DFO)	Science Support, marine mammals

CATALOGUE OF OPERATIONS

The mission completed 15 operations related to this project which are summarized in Table 2. Each operation is assigned a consecutive operation number (CON) for which the data/time, latitude/longitude and depth were recorded along with other metadata. The general location of these operations is shown in Figures 2 and 3. All of the physical oceanographic data collected on this mission as well as the full Cruise Planning Document are deposited in Mendeley and can be retrieved from: <https://data.mendeley.com/datasets/wcs8mjt27d/draft?a=febb07e2-0178-4e93-ae7a-cddd09388fa7>. All maps shown in this report were created in ARCGIS using a NAD83 UTM 20N projection.

Table 2. Metadata associated with each operation completed on HUDSON2021-048.

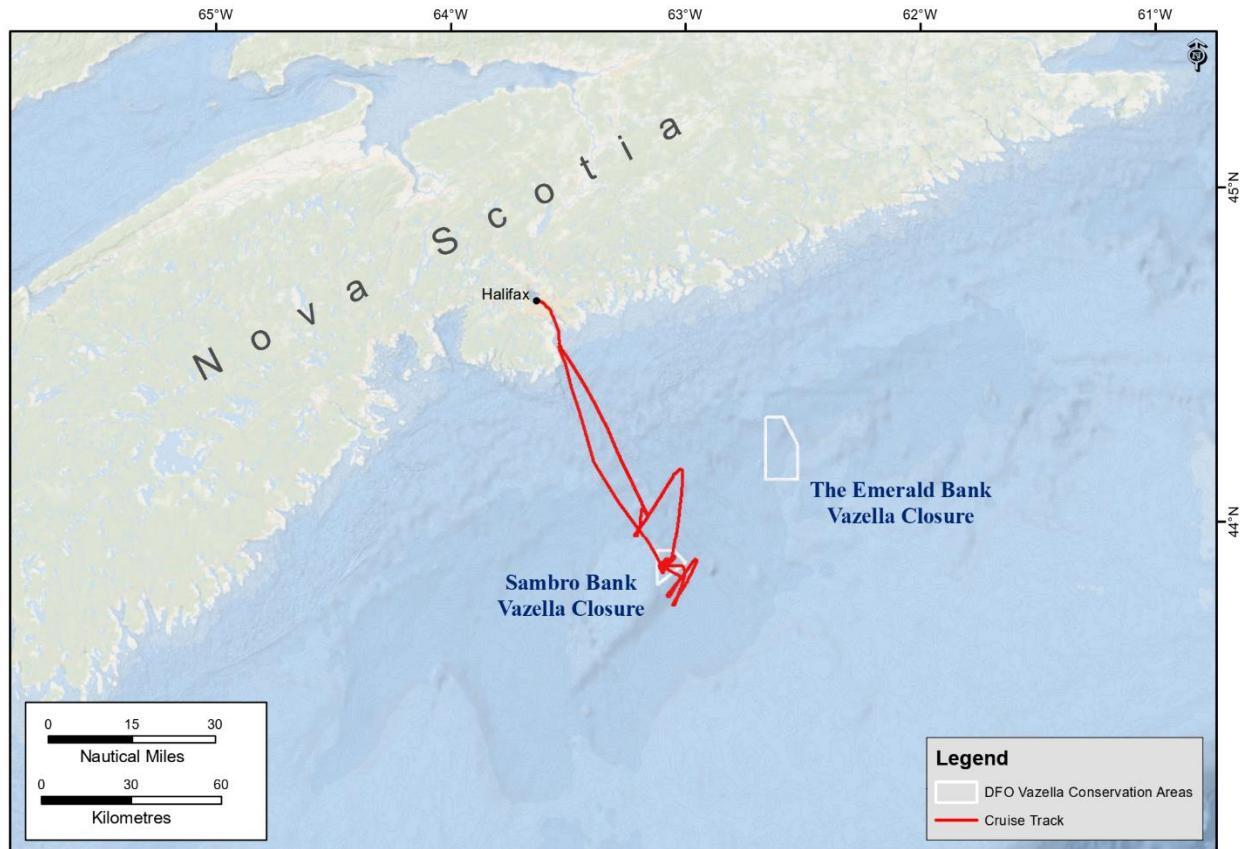

Figure 2. Cruise track (red) for CCGS *Hudson* mission Hudson2021-048, 11-13 September, 2021. The location of the Sambro and Emerald Bank Sponge Conservation Areas are indicated in white outline. Fishing with bottom-contact gears is prohibited in those areas.

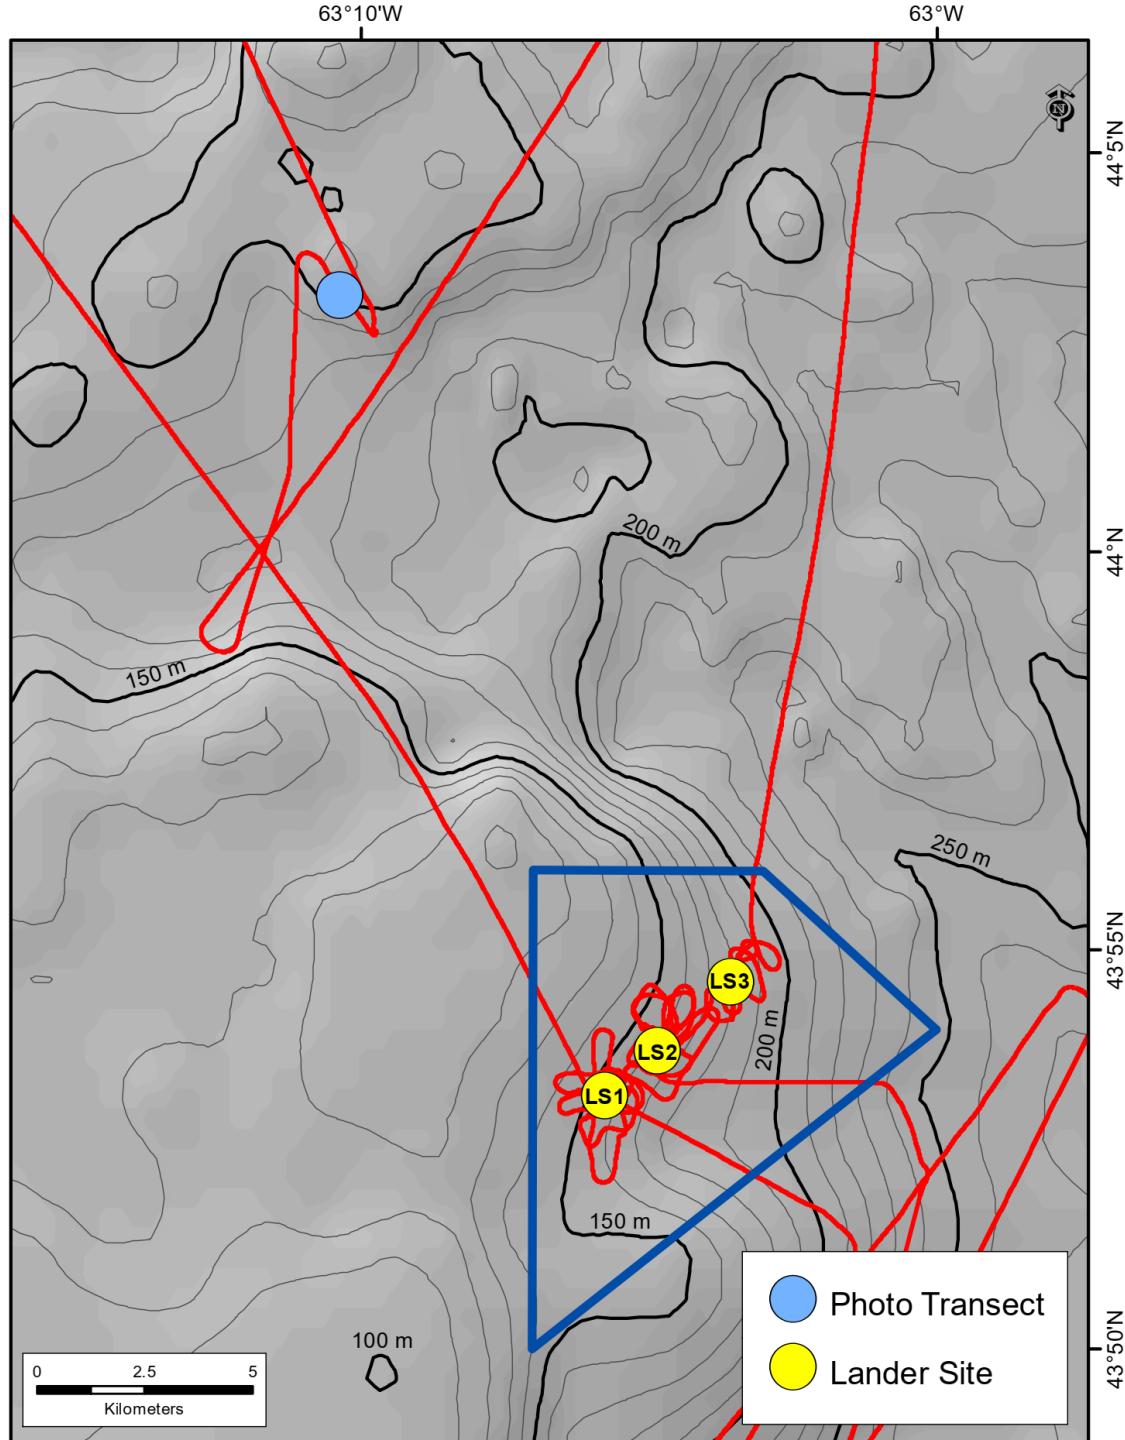

Figure 3. The cruise track (red) for CCGS *Hudson* mission Hudson2021-048, 11-13 September, 2021 showing details of the lander deployment sites (LS1-3) and the location of the additional photo transect (VS-5, CON 015 see Table 2) completed with the 4K Camera. The Sambro Bank Sponge Conservation Area is outlined in blue. Depth contours at 10 m intervals are indicated.

Lander Site 1 (LS1) Overview of Operations

Three 4K Camera photo transects were completed at LS1 (Figure 4), along with a CTD cast and deployment of the lander.

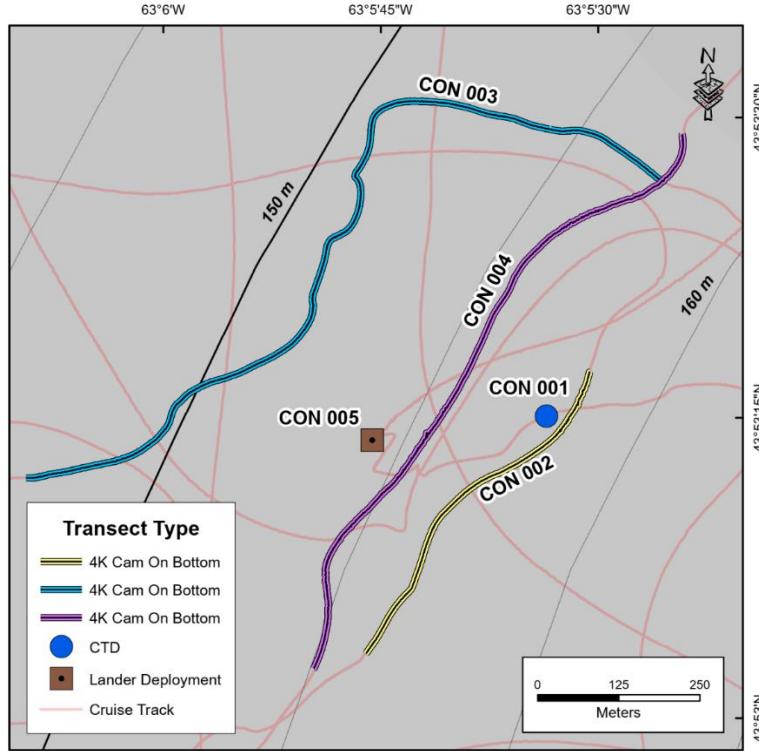

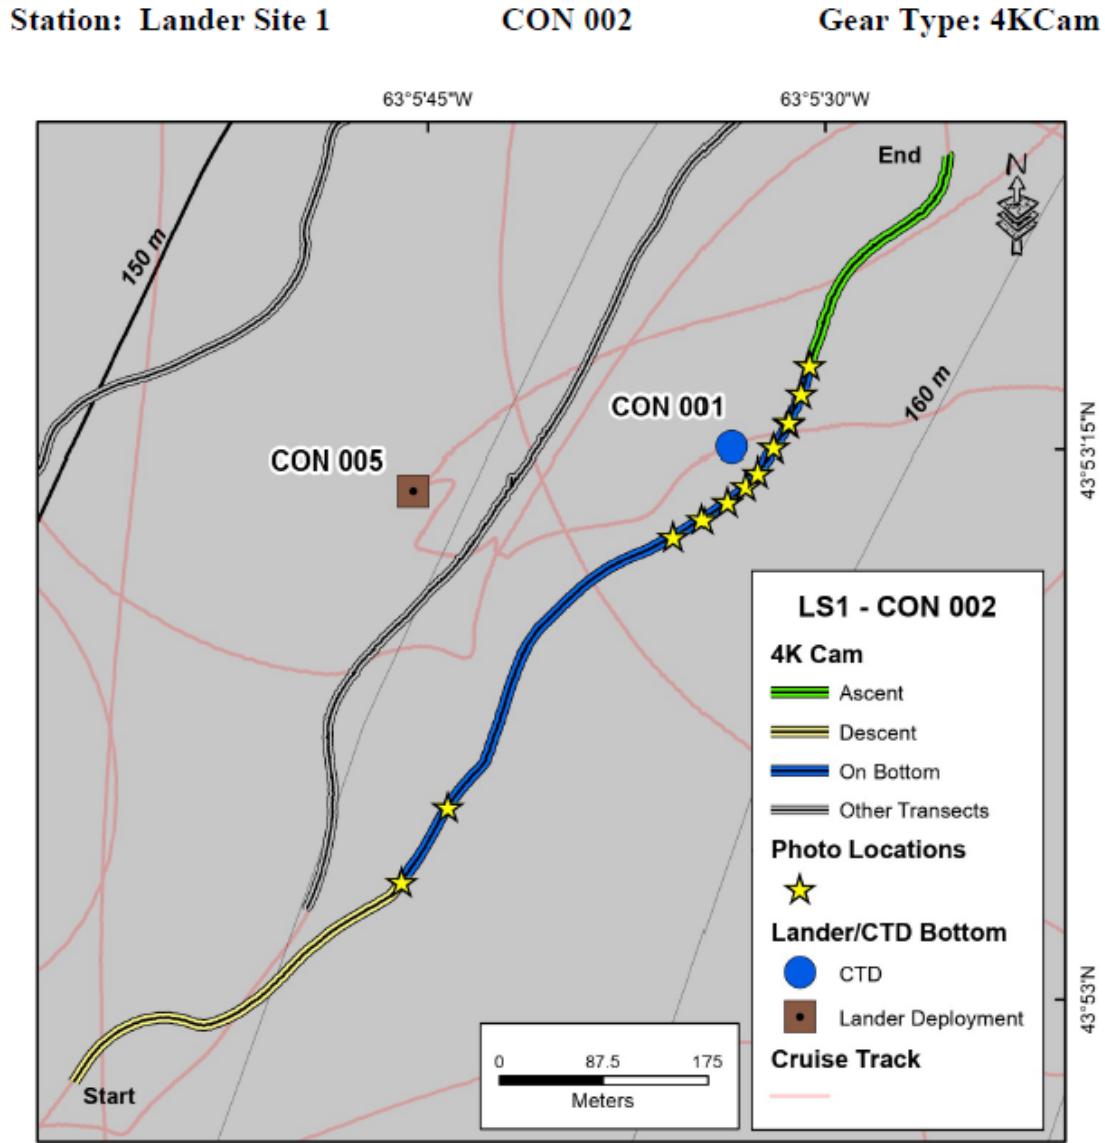

Figure 4. Location of the five operations completed in support of data collection at Lander Site 1. See Table 2 for associated metadata.

Lander Site 1 (LS1) Overview of 4K Camera Operations

Details of the three 4K Camera photo transects from LS1 are found in Figures 5-7. In total 113 photos were taken of which 106 were considered to be of good quality. Of the 106 photos, 31 had live *Vazella pourtalesii* present (29.24 %). The density of live *V. pourtalesii* based on these transects (Table 3) was 0.83 individuals/m². The photos were noticeably darker during these three operations which was attributed to poorer light penetration in the water column due to the after-effects of the hurricane.

Table 3. Density of live *V. pourtalesii* by photo transect (CON see Table 2, Figures 4-7) at LS1.

	CON 002	CON 003	CON 004
Density of <i>V. pourtalesii</i> (individuals/m ²)	0.58	0.64	1.14

Lander Site 2 (LS2) Overview of 4K Camera Operations

Details of the three 4K Camera photo transects from LS2 are found in Figures 9-11. In total 131 photos were taken of which 127 were considered to be of good quality. Of the 127 photos, 40 had live *Vazella pourtalesii* present (31.50 %). The density of live *V. pourtalesii* based on these transects (Table 4) was the highest at 1.74 individuals/m². The photos were noticeably brighter during these three operations than from the previous day although no camera settings were altered.

Repeat Sampling of a Transect Sampled in 2011

A single 4K Camera photo transect completed in 2011 was resampled with the 4K Camera (69 good quality photos) as an additional sampling location (CON015 during the HUD2011-014 mission). The start and end waypoints correspond to VS_5b and VS_5a respectively in the Cruise Planning Document (Appendix 1). This transect had the presence of both live and dead *V. pourtalesii* in 2011. Of the 69 photos taken in September 2021, 25 had live *V. pourtalesii* present (36.23 %). The density of live *V. pourtalesii* based on this transect was 1.05 individuals/m².

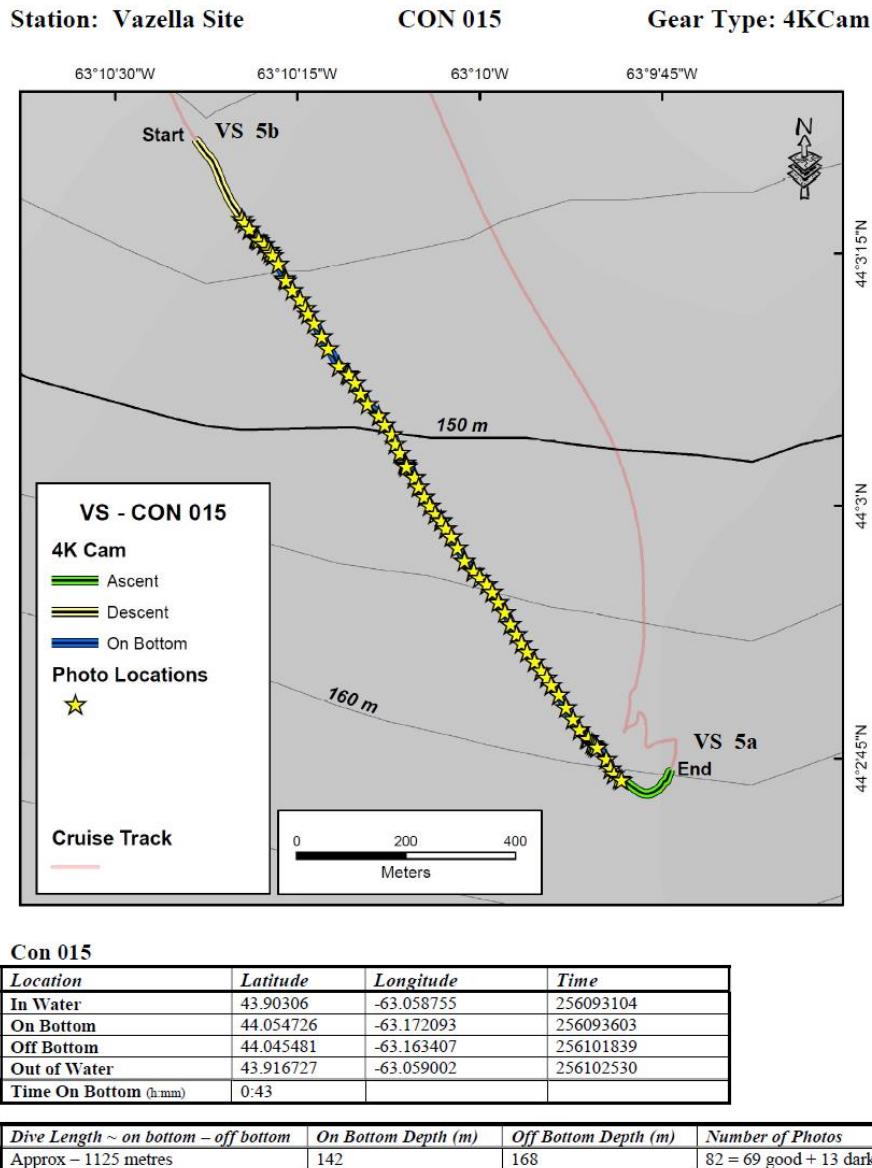

Figure 15. Details of CON 015 4K Camera deployment. See Table 2 for additional associated metadata.

NEW SETTING FOR THE AMAR

Dr. Jinshan Xu made changes to the AMAR Settings on Lander 3 (Figure 16) prior to deployment. These settings replace the settings detailed in the Cruise Planning Document (Appendix 1). The new setting for the AMAR (three channel now, SN 772) is:

560 second @ 64kHz, 340 second sleep for 900 second (15 mins) period. The battery endurance is 288 days, and memory endurance is 324 days. The AMAR was configured to start sampling at 10:55:00 UTC on Sep 12 2021.

Figure 16. Photo of Lander 3 prior to deployment. The AMAR can be seen (black cylinder) with three hydrophones covered by yellow clothes on the top.

FORMALIN SOLUTION FOR THE SEDIMENT TRAPS

The pdf listing the instructions for the sediment traps in the Cruise Planning Document (“FIXO3_BP_Annex_Sediment_traps.pdf”) was not to be followed for the preparation of the sediment traps because we want a 4 % concentration (not 2 % as presented in the pdf). Also, instead of the deep seawater of 35 ppt, we used saltwater from the Bedford Basin sampled at 8 ft below the low tide level that was 29.7 ppt. Therefore more salt was added to adjust the salinity.

The following steps were applied:

- 9L of saltwater was filtered on GF/C filters and then mixed with 100g of sodium chloride to ensure that the salinity would be around 40 ppt.
- 1L of formaldehyde (37-40 %) was mixed with 5 g of Borax.
- 24 hours later (following total dissolution), the buffered formalin solution was mixed in the saltwater (total volume of the preservative solution = 10 L).

The solution was kept at 4°C until put in the sediment trap bottles immediately prior to sailing.

APPENDIX 1: ABRIDGED CRUISE PLANNING DOCUMENT

The full Cruise Planning Document is 65 pages in length and included details of the study sites, equipment and permits:

Prof. Murray Roberts	University of Edinburgh, iAtlantic	Murray.Roberts@ed.ac.uk
Dr. Fred Whoriskey	Ocean Tracking Network	FWhoriskey@Dal.Ca
Dr. Ellen Kenchington	DFO-BIO	Ellen.Kenchington@dfo-mpo.gc.ca
Prof. George Wolff	University of Liverpool	wolff@liverpool.ac.uk
Dr. Christian Mohn	Aarhus University	chmo@bios.au.dk

The OTN collaboration will enable us to capture information on the presence of a suite of species that will complement the acoustic data. OTN has fitted a wide range of aquatic species — e.g., salmon, tuna, whales, sharks, crabs, and seals — with small electronic transmitters that are surgically implanted or attached externally, and can operate for up to 20 years. The acoustic receivers, roughly the size of kitchen food processors, will be attached to the landers (one per lander) and will pick up coded acoustic signals identifying each tagged animal that passes within half a kilometre. The data are subsequently uploaded to a central database, resulting in current and reliable global records that can be analysed and along with similar data from the [OTN Halifax line](#) to document species in the sponge grounds (Whoriskey et al., 2009). “The OTN Halifax line spans the entire width of the continental shelf off Halifax and consists of hydrophone moorings at 800 m spacing over a total length of almost 205 km. This makes it the largest single fixed oceanographic monitoring system in the world. The line meanders to avoid areas of intense trawling activity such as the Emerald Basin. In addition to acoustic receivers, several of these moorings contain benthic pods: instrumented packages that provide time series of bottom pressure (sea level height), temperature and salinity. This massive undertaking took four years to fully deploy. Data stored on receivers or benthic pods are retrieved via autonomous vehicles (gliders), as well as manned vessels. Marine species tagged in over 20 OTN projects have been detected on this line to date” (Whoriskey et al., 2009).

Details of Research

Objectives

Vazella pourtalesii is a relatively large sponge (up to 50 cm) that can form dense biogenic habitats and locally enhances invertebrate biodiversity. Fourteen fish species in trawl catches have been found to be significantly associated with these sponge grounds, including commercially important silver hake, redfish, haddock and northern shortfin squid. Since fish may use these sponge grounds for feeding, spawning, and nursery areas there is a need to collect more information on fish use of this key benthic habitat in order to support decision-making following an ecosystem approach.

To better understand these sponge grounds, this study will compare their health and biodiversity using passive acoustic recordings. Acoustic landscapes, or soundscapes, are composed of biological, geophysical and anthropogenic sounds, and in some environments, such as tropical coral reefs, biological components dominate the soundscape. Due to the more remote and inaccessible nature of open ocean or deep-sea ecosystems, soundscape recordings have been limited.

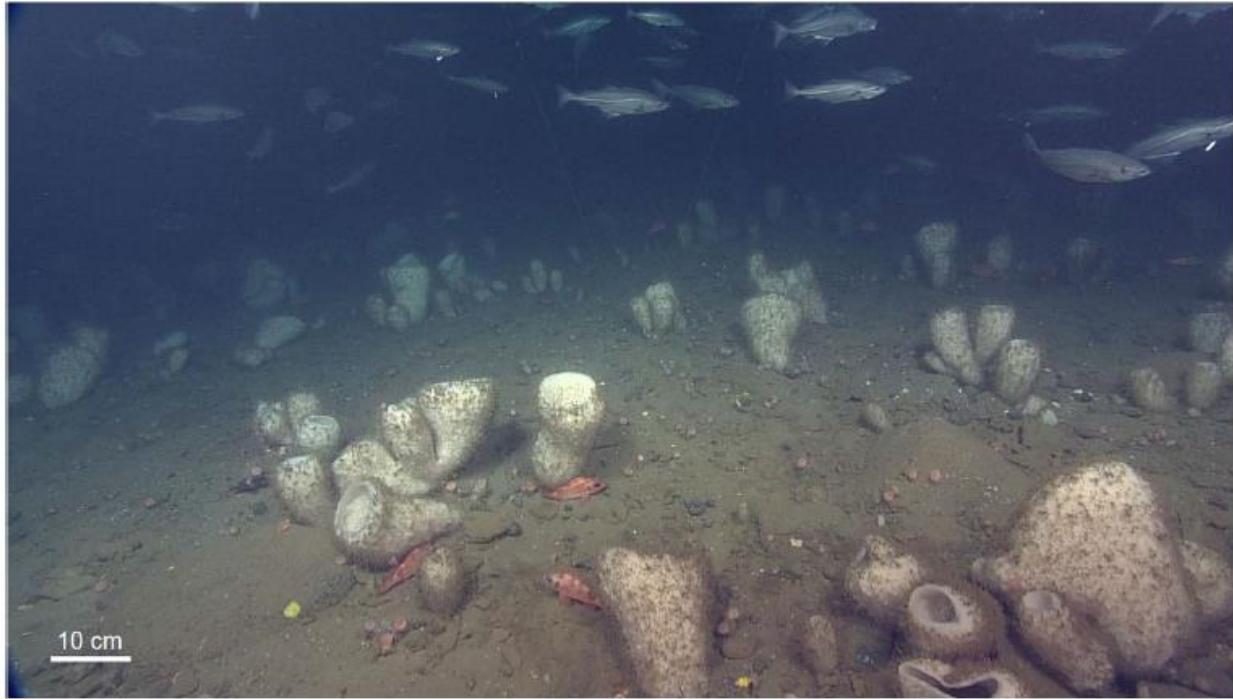

Figure 1. Sponge grounds formed by *Vazella pourtalesii* in the Sambro Bank Sponge Conservation Area, Emerald Basin, NS. Depth is 155 m. A school of Pollock is swimming over the sponges and redfish are seen on the seabed taking shelter at the sponge bases.

The project has five overall objectives:

Objective 1: Characterize the biological sounds at the Sambro Bank Basin – led by Laurence De Clippele

Biological sound emissions will be catalogued in the wild using combined acoustic and photo recordings (Mouy et al., 2018). This combined approach will allow us to associate/ correlate sounds of fish (e.g., pollock, redfish) with their behaviours (e.g., mating, scaring off predators, territorial protection) visible in the photos in order to inform ecosystem management decision-making. The pollock are believed to spawn in the fall so we are hopeful that the timing of our landing deployment will enable us to capture this event.

The biological acoustic data will be annotated and classified using Raven Pro software. The 1/3 Octave frequency bands will be generated using a Hann window at 1-second resolution, without overlap, using PAMGuide (Merchant et al., 2015) in the Matlab software version R2018a, yielding a 1 Hz frequency resolution for the purpose of identifying soundscape components. Since most fish vocalize and hear in the low frequency range (Amorim, 2006), audio recordings may require down-sampling. Sound types will be divided into 2 main categories following Amorim (2006) and Desiderà et al. (2019): (1) frequency-modulated signals, (2) series of at least 3 short broadband transient pulses that can be either stereotyped or irregular.

The image data will be annotated using BIIGLE or a similar online annotation software. The presence of fish, and their density will be correlated to the biological sounds. Fish sounds will also be cross-referenced with the video and nearby OTN data (<https://oceantackingnetwork.org/>) to establish a library for each species observed.

Objective 2: Characterization of ambient noise levels on the sponge grounds- led by Jinshan Xu and Laurence De Clippele

Sound pressure energy (or ambient noise level) is usually much higher in the low frequency range, and then decreases as frequency decreases up to the 20 kHz frequency range. Distant ship traffic is one of the dominant noise sources for frequencies of around 100 Hz, while wind-induced surface noise is the main source between 1 kHz and 30 kHz where fish vocalize. We will analyse power spectrum densities (see Archer et al. 2018, Breeze et al. 2021) from the recorders and cross-reference with Automatic Information System (AIS) data for shipping traffic, surface wind data from the Canadian Operational Network of Coupled Environmental Prediction Systems (CONCEPTS) project, *in situ* current data from the ADCP, and CTD data to estimate how much shipping and meteorological processes are contributing to ambient noise. Particulate Organic Matter (POM) data can be used to account for variation in the ambient noise levels due to the amount of suspended particles in the water column.

Objective 3: Evaluate the use of sound as an indicator of fish biodiversity – led by Laurence De Clippele

Passive acoustic monitoring was put forward as a non-invasive monitoring technique at a recent CSAS meeting (Neves et al., 2020). Desiderà et al. (2019) found a strong relationship between taxonomic and acoustic diversity as measured by richness, diversity and community similarity indices. Overall, acoustic communities showed stronger differences between sites and a higher discriminating potential. We will calculate acoustic indices to evaluate the use of sound as a biodiversity and health indicator of the Vazella sponge grounds (Desiderà et al., 2019; Pieretti & Danovaro, 2020; Righini & Pavan, 2020; Dimoff et al., 2021). The fish sound repertoire will be organized into a dichotomous tree based on acoustic characteristics (Amorim, 2006) for use as a biodiversity indicator for resource monitoring and management. The biodiversity will also be cross-referenced with the fish and crustacean presence/absence and density and the environmental data, i.e., POM, current speed, current direction, temperature, shipping traffic, windspeed and sponge density.

Objective 4: Screen the acoustic signals for presence of North Atlantic Right Whale – led by Jinshan Xu

The North Atlantic Right Whale is an endangered species. This objective is shared with Project 557 in DMAApps, OPP Science - Marine Environmental Quality (Jinshan Xu). The signals from other baleen whales' calls will be also studied under this project.

Objective 5: Collect environmental data to explain patterns of high and low sponge density – led by Laurence De Clippele, Christian Mohn, George Wolff

The landers will be placed in areas of high and low sponge density and in an area where dead sponges were observed. Sediment traps will be placed on the landers that are located in the high and dead sponge areas to determine environmental differences that may be responsible for the differences in sponge density and condition.

Study Locations and Operations

The Sambro Bank Sponge Conservation Area (<https://www.dfo-mpo.gc.ca/oceans/oecm-amcepz/refuges/emerald-emeraude-eng.html>) is located ~100 km from Halifax (Canada) on the Scotian Shelf and protects *Vazella pourtalesii* sponge grounds from bottom-contact fishing. Sambro bank was selected for three reasons:

- (1) it is removed from major cargo shipping lanes, therefore reducing the amount of noise pollution in the sound recordings;
- (2) it is protected from bottom trawling, therefore reducing the risk of equipment being lost and/or damaged;
- (3) by deploying the sound recorders in the same area the variability in ambient noise is reduced which will make biodiversity indices comparisons more robust.

Hanz et al. (2020) deployed a single lander in this area under the SponGES EU Horizon 2020 project. Their lander was equipped with temperature and oxygen sensors, a current meter, a sediment trap and a video camera. They found: “Over the course of the lander deployment, temperature fluctuated between 8.8–12°C with an average of $10.6 \pm 0.4^\circ\text{C}$. Dissolved oxygen concentration was on average 6.3 mg l^{-1} , and near-bottom current speed was on average 0.12 m s^{-1} with peaks up to 0.47 m s^{-1} . Semi-diurnal tidal currents promoted constant resuspension of particulate matter in the benthic boundary layer. Surface storm events episodically caused extremely turbid conditions on the seafloor that persisted for several days, with particles being resuspended to more than 13 m above the seabed. The carbon flux in the near-bottom sediment trap peaked during storm events and also after a spring bloom in April, when fresh phytodetritus was observed in the bottom boundary layer” (Hanz et al., 2020).

Three deployment locations for the three benthic landers (on loan from the University of Edinburgh), with varying degrees of sponge ground health have been selected based on the sponge densities measured from CAMPOD video and still photo data collected during the 2011 DFO Emerald Basin expedition (Characterization of VME for Assessment of Significant Adverse Impact by Bottom Trawling and Development of Encounter Protocols; HUD2011-014). That data

was presented in an unpublished report “Analysis of *Vazella pourtalesii* Emerald Basin” DFO Ecosystems Research Division September 2011 undertaken by the offshore benthic ecology group (lead Dr. E. Kenchington). The areas are designated as follows: High Density Sponge, Low Density Sponge and Dead Sponge. [Note that the density of sponges from the 4K Camera photos were processed at sea and these designations were changed post-hoc].

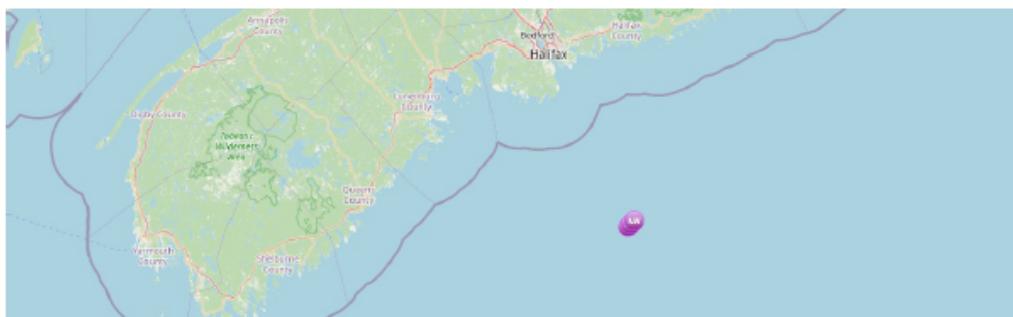

Figure 2. Photo showing a dead sponge (upper left) from the Sambro Bank Sponge Conservation Area. Dead *V. pourtalesii* are readily distinguishable from the living sponges (Figure 1). Green lasers are approximately 10 cm apart for scale.

APPENDIX 4: EXAMPLE 4K CAMERA PHOTO

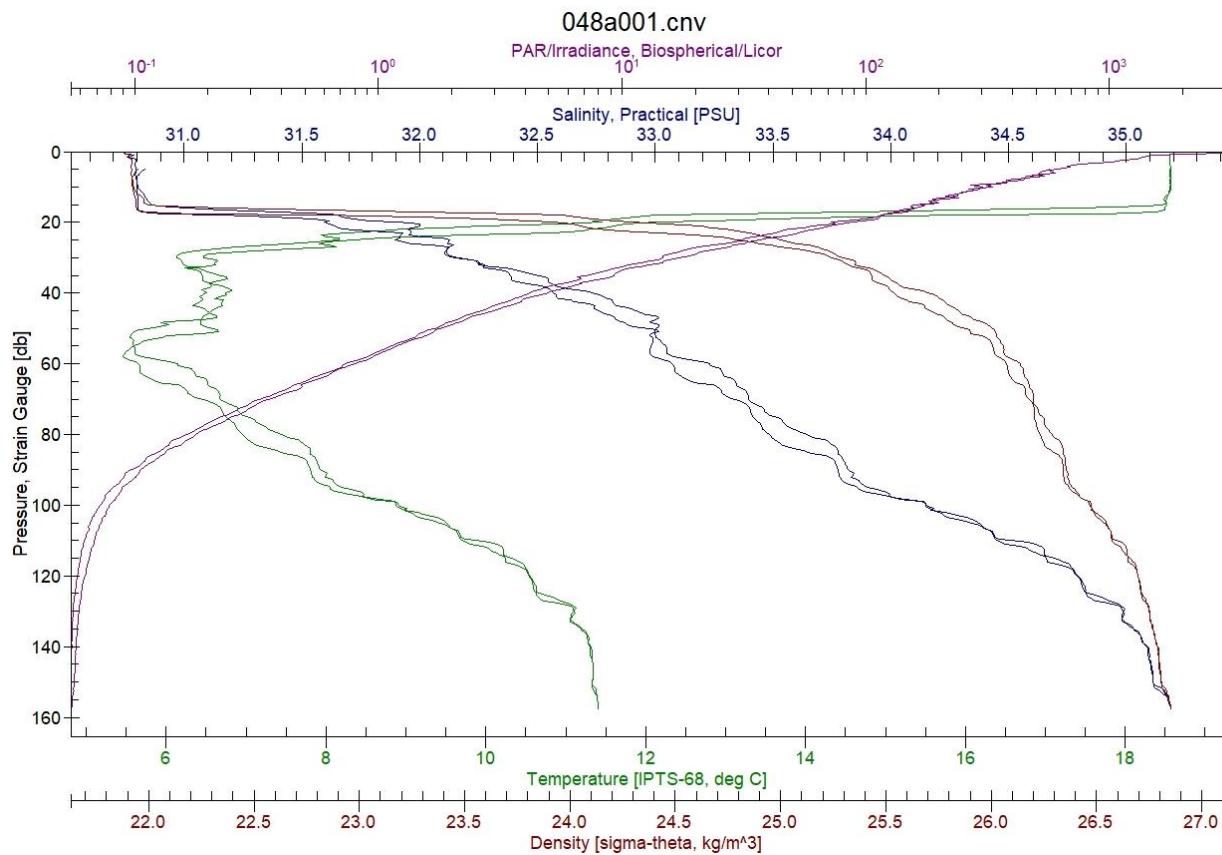

This photo is of IMG_1460.jpg. Metadata associated with the photo can be found in Appendix 3 by searching under the image name. The original photo was enhanced in Word by increasing brightness by 24% and increasing contrast by 7%. The laser dots were enhanced (red closed circles) for scaling (10 cm). The drop weight shown in the image is 10 cm in diameter as shown in the next photo below. The weight can be used to scale the field of view or to estimate the size of features shown in the photos if the lasers are not visible. The image shows the presence of 5 colonies of *Vazella pourtalesii* (bright white vase sponge).

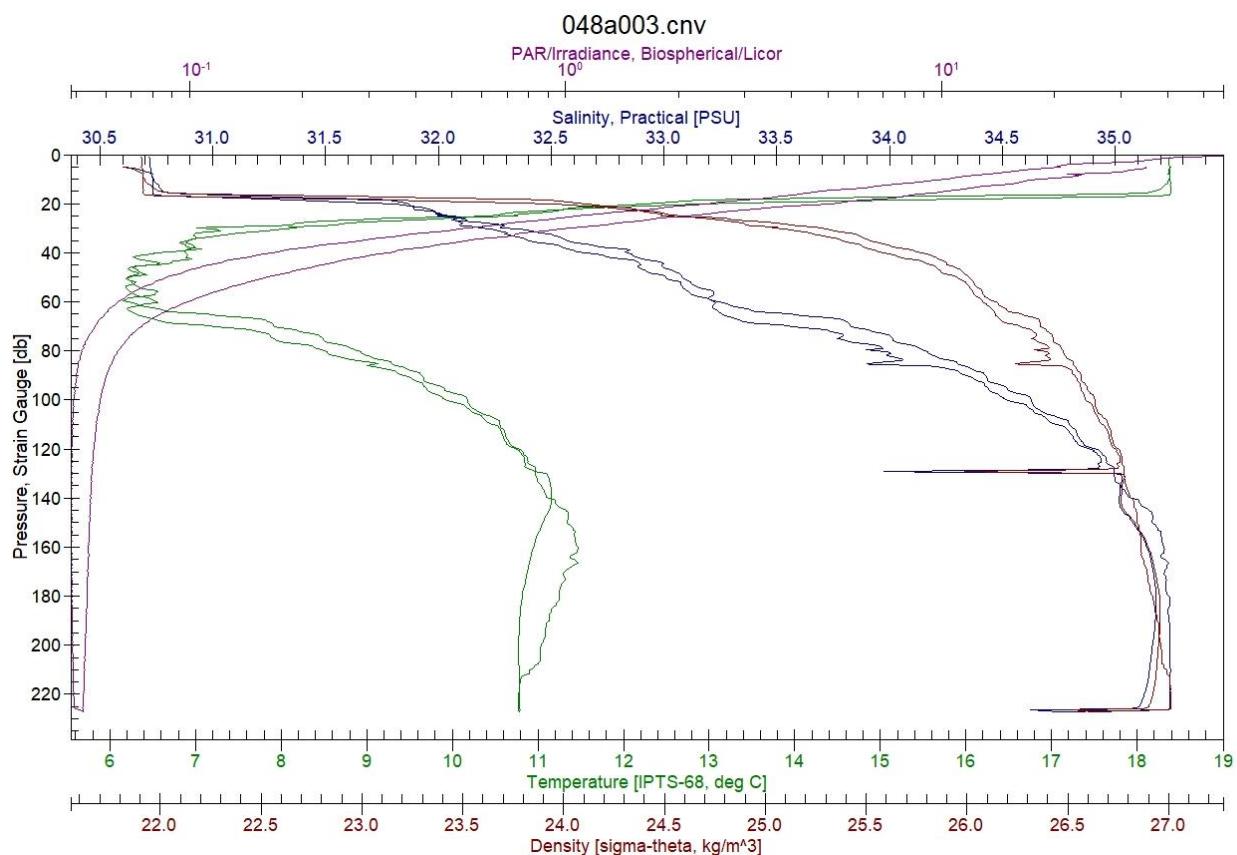

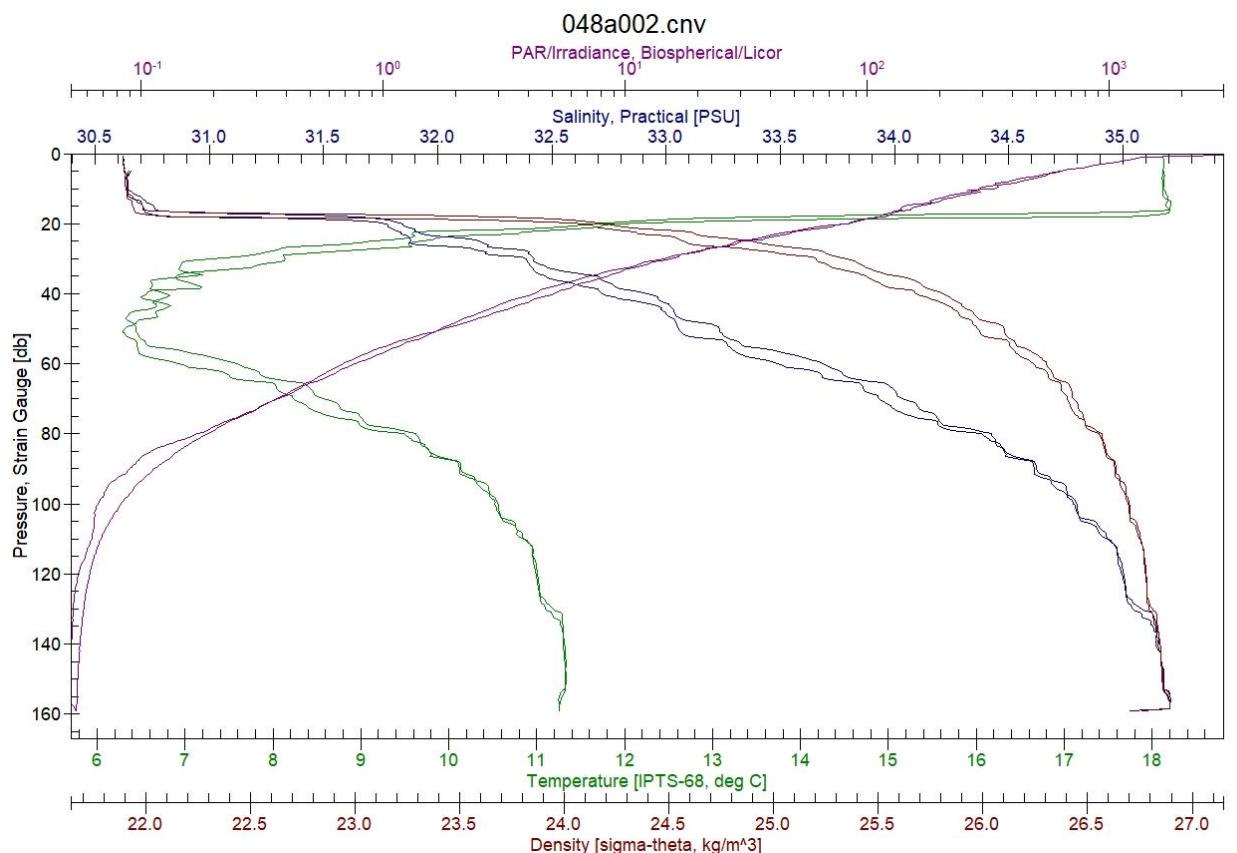

Image of the drop weight used to trigger a photo with the 4K Camera. The weight is 10 cm in diameter and can be used as back-up scale if the lasers are not visible.

APPENDIX 5: CTD PLOTS

The three CTD stations (Table 2) were CON 001 (LS1), CON 009 (LS2) and CON 013 (LS3). The CTD data (including the PAR sensor) were post processed by Dr. Edward Horne, and the graphics prepared by Barry MacDonald, both of the Bedford Institute of Oceanography, Dartmouth, Nova Scotia and are shown below in sequence (LS1-3).

APPENDIX 6: HUD2021-048 - TIME LAPSE CAMERA SYSTEM

Overview

This overview was provided by Kirk Phelan, Bedford Institute of Oceanography, Dartmouth, Nova Scotia after the Cruise Planning Document was finalized and so is included here for future use. Three time lapse camera systems have been developed by the Ocean Engineering and Technology Section (OETS) in support of this mission. The cameras on the Landers are set to take an image at the top and bottom of every hour (2 images/hr). The three camera systems are identical and were mounted to the three separate landers. Each camera system consists of three components:

1. Camera pressure housing
 - a. Sony RX0 15MP DSLR;
 - b. Custom designed embedded controller;
 - c. Custom acetyl pressure case with acrylic flat port. Depth rating of 500 meters.
2. Battery housing
 - a. Battery pack containing 15 (x5 series, x3 parallel) Saft LHS20 lithium primary batteries (18V nominal). Excell Battery Company PN: 2EXL1910.
 - b. Custom ORing diode PCB;
 - c. Custom acetyl pressure housing. Depth rating of 500 meters.
3. DeepSea Power and Light LED SeaLite Sphere – PN: LSL-2075
 - a. 5k lumen output (low power mode), 75 degree beam angle, daylight white;
 - b. 10-48VDC input, 53W in low power mode (<18VDC);
 - c. Aluminum housing with anodes, sapphire port. Depth rating of 4,000 meters.

Figure 1. Time Lapse camera system mounted to lander for test deployment.

Deployment Schedule Settings

The Time Lapse custom embedded controller puts the system into a very low power sleep state between image captures. The controller determines the schedule on which the system will wake up to capture an image. This schedule is set via a menu accessed by a serial interface to the embedded controller. The controller will be put in deployment mode before the landers are loaded on the vessel. The deployment procedure and first wake will be captured by a serial terminal application. A general deployment procedure is located in the body of this document. The image capture schedule is as follows.

Time zone	UTC
Daylight savings	Off
Image (wake) interval	30 minutes
Initial wake time	Top of the hour. Note: an image is captured approximately 10 seconds after the system wakes.

Clocks

The time lapse camera system has two independent clocks, one is internal to the Sony RX0 camera and the other is internal to the embedded controller. The still image EXIF data and file naming use the RX0 internal clock while the embedded controller clock determines the system wake time. These two clocks will drift during deployment. To determine the clock drift during post processing the exact time each clock was set needs to be recorded. Clocks are to be set to UTC.

Lander #	Time Lapse #	Time the RX0 clock was set (YYYY-MM-DD-HH:MM:SS)	Time the controller clock was set (YYYY-MM-DD-HH:MM:SS)
Lander 1	TL-001	UTC	UTC
Lander 2	TL-002	UTC	UTC
Lander 3	TL-003	UTC	UTC

Note: Without the primary external battery pack and Sony RX0 internal clock will reset within a few days. Do not leave the system unplugged for extended periods of time.

SD Card and Battery

Each camera stores images to a 128GByte SD card. The still images will be recorded as JPEGs which can vary in size due to compression. The maximum JPEG size recorded during testing was just over 9Mbytes. Although the SD card can store more than 14,000 images, the embedded controller limits the total images taken to 13,500 images. This limit is for various engineering purposes. Images will be taken every 30 minutes for the 9 month deployment (274 days), which totals 13,152 images.

The calculated capacity of the battery pack in 27Ah at 2 degrees Celsius and the estimated power consumption for 13,000 images is 14Ah, leaving a roughly 50% safety factor.

Mounting Details

The following describes the details of how the camera and light are mounted to each lander.

Mounting Details - Lander 1 (TL-001) & Lander 2 (TL-002) & Lander 3 (TL-003)

Camera height off bottom (to center of viewport)	108cm
Camera angle from horizontal	-30 degrees
LED height off bottom (to center of port)	164cm
LED angle from horizontal	-25 degrees
LED vertical offset from camera	20cm
LED angle along z-axis (pointing toward camera)	7 degrees

Sony RX0 Camera Setting

The following describes the camera image settings for the Sony RX0 for each lander.

Sony RX0 Settings - Lander 1 (TL-001) & Lander 2 (TL-002)

Setting	Selection	Note
Shoot Mode	Program Auto	Selected using Memory Recall 1
Aperture	f/4.0	Sony RX0 has no aperture control and is fixed at f/4.0
Shutter Speed	Auto	
ISO	3200	Fixed ISO
EV (Exposure Value)	-1.0	Reduces the default brightness, which will increase shutter speed reducing smearing of moving fish
Recording Format	JPEG only	
Image size	L:15	Large - 15 Megapixels
Image quality	Extra Fine	Highest quality JPEGs available
Aspect ratio	3:2	Full sensor size
Focus	Manual: ~1.5 m	Bar selector: 5 clicks right of the 0.7 m marker
Zoom	Max Wide	Bar selector: all the way to the left

Sony RX0 Settings - Lander 3 (TL-003) - Unique Settings (All other setting are the same as Lander 1 & 2)

Setting	Selection	Note
Shoot Mode	Program Auto	Selected using Memory Recall 1
Shutter Speed	Auto	
ISO	4000	Fixed ISO
EV (Exposure Value)	-1.0	Reduces the default brightness, which will increase shutter speed reducing smearing of moving fish

Additional Sony RX0 Specifications

Specification	Value	Note
Aperture	f/4.0	Sony RX0 has no aperture control and is fixed at f/4.0
Effective Pixels	15.3MP	
Horizontal Angle of View	84 degrees	When underwater the horizontal angle of view will be reduced by the flat port (magnification of approximately 25%).
RAW images		
Still Image Recording Formats	JPEG, RAW	All still images on this deployment will be JPEGs.

General Deployment Procedure

The initial deployment date-time is stored in volatile memory. If the battery is unplugged after the deployment schedule has been set, the camera should be manually redeployed. If the camera is not manually redeployed it will automatically deploy waking 30 minutes from the time the battery was plugged in.

To manually deploy the camera plug in the Time Lapse MCIL8F user interface cable and then to a laptop with a serial port. A terminal program must be used to set the deployment parameters. Setting up the deployment parameters and deploying the camera should be captured to a file using a terminal program.

The time lapse camera serial port communication settings are as follows.

Baudrate	115,200
Data bits	8
Parity	None
Stop bits	1
Flow control	None

If **RE**-deploying it is recommended to unplug the primary battery pack, wait 30 seconds, and then plug the battery pack back in.

Once power is applied a countdown will begin on the terminal program and two tildas (~) are required to display the user menu. The system will automatically go back to sleep in 10 seconds if two tildas are not received. If this occurs press the button on the user interface cable three times to wake the system and start the countdown again. A user menu should appear on the terminal once two tildes are received.

The steps to deploy the system are below:

Step	Menu command	Input data	Description
1	“GETCK”	Nil	Check the system clock
2	If required “SETCK”	“YYYY-MM- DDTHH:MM:SS”	If required set the clock to the current time in UTC. Record the exact time the clock was set. The clock will drift during deployment so this value will be required for post processing.
3	“SETWI”	“00-00:30:00”	30 minute wake interval. The system default is 30 minutes.
4	“SETDT”	“YYYY-MM- DDTHH:MM:SS”	Set the deployment time. It is recommend to deploy the system so the user can watch and record the first deployment on a terminal application.
5	“DPLY”	“Y” to deploy “N” to cancel	Deploy the system. Review and current system time, deployment date, and wake interval for accuracy.

Please note, the Sony RX0 camera settings are saved to its internal non-volatile memory and cannot be changed using the user interface cable. The camera settings can only be changed by using Sony’s Imaging Edge Mobile application for Android or ISO operating systems or directly on the camera body.

Recovery Procedure

The time lapse camera system engineering data is stored to the embedded controller volatile memory and will be lost if the system loses power. Do not unplug the battery until engineering data has been recovered. The camera images are saved to a separate SD card which is non-volatile.

To download the engineering data plug in user Time Lapse interface cable (MCIL8) to the camera and then to a laptop with a serial port. A terminal program must be used to capture the engineering data.

The time lapse camera serial port communication settings are as follows.

Baudrate	115,200
Data bits	8
Parity	None
Stop bits	1
Flow control	None

Set the terminal application to record/capture to file.

Press the button on the user interface cable three times within 5 seconds to wake up the system. A countdown will begin on the terminal application and two tildas (~) are required to fully wake the system and display the user menu. If the system goes back to sleep repeat the button presses and tildes. When the user main menu appears on the terminal application enter the engineering menu by types “ENG”. Once in the engineering menu capture the output from the following commands:

“GETRC”, “GETEVT”, “GETERR”, “GETWC”, “GETAH”

Save the recording/capture to file. The battery can now be disconnected.

Time Lapse Camera - Deployment Checklist

Lander #: _____ #: _____	Time Lapse		
Check each parallel battery (x3) for correct voltage		Y/N	
Install desiccant in battery housing		Y/N	
Battery voltage (at MCBH2F connector)		Volts	
Configure ALL RX0 menu settings according to <i>RX0 Time Lapse Settings</i> spreadsheet and <i>HUD2021-048 - Time Lapse Camera System</i> word document.		Y/N	
Format SD card and ensure inserted correctly. SD card can be inserted backwards!		Y/N	
Set RX0 clock to UTC and record time set.	YYYY:MM:DD- HH:MM:SS	Time	
Using ALCOHOL FREE lens cleaner, clean inside of pressure housing viewport and inspect for debris.		Y/N	
Clean RX0 lens.		Y/N	
Install desiccant in camera housing.		Y/N	
Inspect and re-lubricate end-cap O-rings.		Y/N	
Assemble camera housing using #10-32 3/4" Titanium bolts.		Y/N	
Fill camera housing with argon via purge plug.		Y/N	
Inspect all underwater cables.		Y/N	

Camera height (center of port)		cm
Camera angle (from horizontal)		deg
LED light height		cm
LED vertical offset from camera		cm
LED light angle (from horizontal)		deg
LED light angle (z-axis)		deg
Tighten all camera mounting fasteners		Y/N
Tighten all LED light mounting fasteners		Y/N
Tighten all battery pack mounting fasteners		Y/N
Using ALCOHOL FREE lens cleaner, clean outside of pressure housing viewport and inspect for debris.		Y/N
Using MCIL8F interface cable connect to camera and begin file capture on serial terminal application.		Y/N
Using the Imaging Edge Mobile application on an Android/IOS tablet, ensure SD cards show 9,999 images remaining.		Y/N
Manually take test image and ensure LED light flashes and image is correctly displayed on tablet. Manually disable camera and unplug battery.		Y/N
Manually enable LED and record system current. Disable LED.		Amps
Set controller clock to UTC and record time set.	YYYY:MM:DD-HH:MM:SS	Time
Set deployment time to top of the hour		Y/N
Deploy camera		Y/N
Record first deployment. Save file. Name to match lander#.		Y/N
Flash visible during first deployment?		Y/N
