Analysis of the cod stock in NAFO Division 2GH
by
J. Baird and C. Bishop

Fisheries Research Branch
Department of Fisheries and Oceans
P.O. Box 5667

St. John's, Newfoundland A1C $5 \times 1$

1 This series documents the scientific basis for fisheries management advice in Atlantic Canada. As such, it addresses the issues of the day in the time frames required and the Research Documents it contains are not intended as definitive statements on the subjects addressed but rather as progress reports on ongoing investigations.

Research Documents are produced in the official language in which they are provided to the Secretariat by the author.
${ }^{1}$ Cette sërie documente les bases scientifiques des consefls de gestion des pêches sur la côte atlantique du Canada. Comme telle, elle couvre les problèmes actuels selon les échëanciers voulus et les Documents de recherche qu'elle contient ne doivent pas être considérés comme des énoncés finals sur les sujets traitēs mais plutôt comme des rapports d'étape sur les études en cours.

Les Documents de recherche sont publiés dans la langue officielle utilisée par les auteurs dans le manuscrit envoyé au secrétariat.

## Abstract

The nominal catches from this stock have ranged from $94,000 \mathrm{t}$ in 1966 to 300 t in 1973. A TAC of $20,000 \mathrm{t}$ was adopted in 1974, and has remained at that level. Since that time the TAC has never been exceeded. The 1978 and 1979 year-classes were the most abundant in the commercial catch in 1984. Previous assessments have indicated that fishing mortalities were below $\mathrm{F}_{0.1}$ for this stock for which the estimated MSY catch is $40,000 \mathrm{t}$.

Résumé

Les prises nominales dans le cas de ce stock ont variè de 94000 t en 1966 à 300 t en 1973. En 1974, on a fixé un TPA de 20000 t qui n'a pas changé depuis et qui n'a jamais été dēpassē. Les classes d'âge de 1978 et 1979 ont ētē les plus abondantes dans la prise commerciale de 1984. Des évaluations antérieures ont indiquē que les mortalitēs par pêche ētaient inférieures à $F_{0.1}$ pour ce stock dont le RMS (rendement maximal soutenu) est évalué à 40000 t.

Catches from this stock have ranged from $94,000 \mathrm{t}$ in 1966 to 300 t in 1973 (Fig. 1). The TAC has been maintained at $20,000 \mathrm{t}$ since its introduction in 1974. Except for 1982, catches have been less than half this level, as indicated below:

|  | 1976 | 1977 | 1978 | 1979 | 1980 | 1981 | 1982 | 1983 | 1984 | 1985 |

| TAC (000't) | 20 | 20 | 20 | 20 | 20 | 20 | 20 | 20 | 20 | 20 |
| Nom. catch | 6 | 4 | 5 | 2 | 3 | 4 | 14 | $2^{\mathrm{a}}$ | $1^{\mathrm{a}}$ |  |
| a preliminary. |  |  |  |  |  |  |  |  |  |  |

Commercial catches by country and month are shown in Table 1 and the sampling coverage is indicated in Table 2 for Div. 2H. Catches were once again almost entirely from Div. 2 H . Using these data, the catch at age, average length at age, and average weight at age were estimated for 1984 (Table 3). The percentage discrepancy between calculated catch weight and reported catch weight was less than $1 \%$. The 1978 and 1979 year-classes (Table 4) were most abundant while the 1973 year class (age 11) continued to show considerable strength.

The catch at age for the years 1962-71 was presented by Wells (1973) and used in a virtual population assessment. The level of sampling during 1972-77 was very low, consequently, no age distribution of catch was obtained. Catch levels since that time have remained low, apart from that for 1982, but sampling has been sufficient to obtain estimates of catch at age (Table 4).

Catch rates, obtained from Canadian observers on foreign vessels (Table 5) were generally obtained from relatively small catches and showed considerable fluctuation. Catch rates from the Faroese long line fishery have been stable in recent years but showed some decline in 1984.

Estimates of population abundance and biomass were not obtained because of previously mentioned problems with estimates of catch at age and the lack of a suitable catch rate series for tuning.

Previous assessments have indicated that fishing mortalities were below Fo. for this stock for which the estimated MSY catch is $40,000 \mathrm{t}$. Fishing activity in this area was once again low during 1984 with only $7 \%$ of the TAC being caught.
